Standards for Inpatient Electrocardiographic Monitoring

Oct 04, 2017 | [Richard L. Weinberg, MD, PhD, FACC](#)

Authors:

Sandau KE, Funk M, Auerbach A, et al., on behalf of the American Heart Association Council on Cardiovascular and Stroke Nursing; Council on Clinical Cardiology; and Council on Cardiovascular Disease in the Young.

Citation:

[Update to Practice Standards for Electrocardiographic Monitoring in Hospital Settings: A Scientific Statement From the American Heart Association. *Circulation* 2017;Oct 3:\[Epub ahead of print\].](#) 

Update to Practice Standards for Electrocardiographic Monitoring in Hospital Settings

A Scientific Statement From the American Heart Association

Endorsed by the American College of Cardiology, American Association of Critical-Care Nurses, and Pediatric and Congenital Electrophysiology Society

The comprehensive document is grouped into 5 sections:

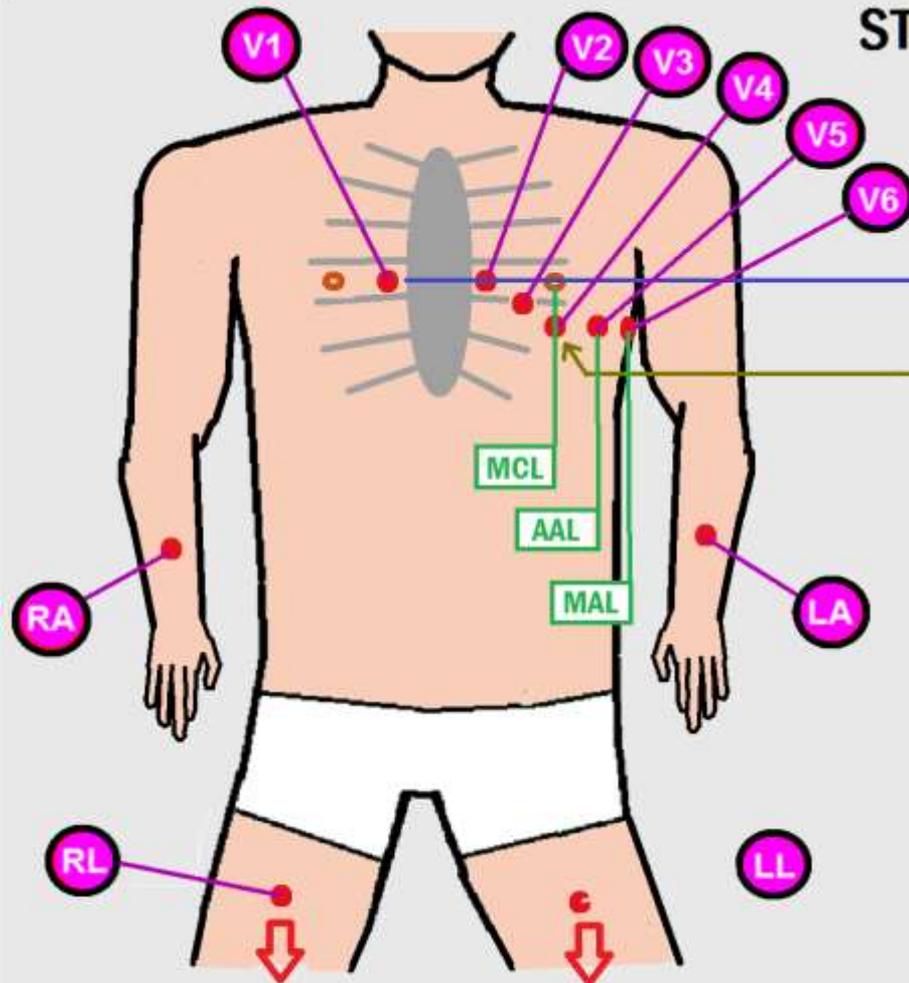

- (1) Overview of Arrhythmia, Ischemia, and QTc Monitoring;
- (2) Recommendations for Indication and Duration of Electrocardiographic Monitoring presented by patient population;
- (3) Organizational Aspects: Alarm Management, Education of Staff, and Documentation;
- (4) Implementation of Practice Standards; and
- (5) Call for Research.

The goals of electrocardiographic monitoring have expanded from simple heart rate and basic rhythm determination to the diagnosis of complex arrhythmias, the detection of acute and often silent myocardial ischemia, and the identification of drug-induced prolonged QT interval. The first American Heart Association (AHA) scientific statement on practice standards for electrocardiographic monitoring in hospital settings was published in 2004¹ and provided an interprofessional, comprehensive review of evidence and recommendations for continuous electrocardiographic monitoring of hospitalized patients.

Understanding “multiple leads” ...

- Correct location of each ECG Lead

Obtaining the 12 Lead ECG

STANDARD LEAD PLACEMENT --- 12 LEAD ECG

4 th INTERCOSTAL SPACE

V4 is at 5th INTERCOSTAL SPACE. V5 & V6 are on the SAME HORIZONTAL PLANE.

- PATIENT SHOULD LAY AS FLAT AS POSSIBLE
- LIMB LEADS SHOULD BE PLACED AS DISTALLY AS POSSIBLE

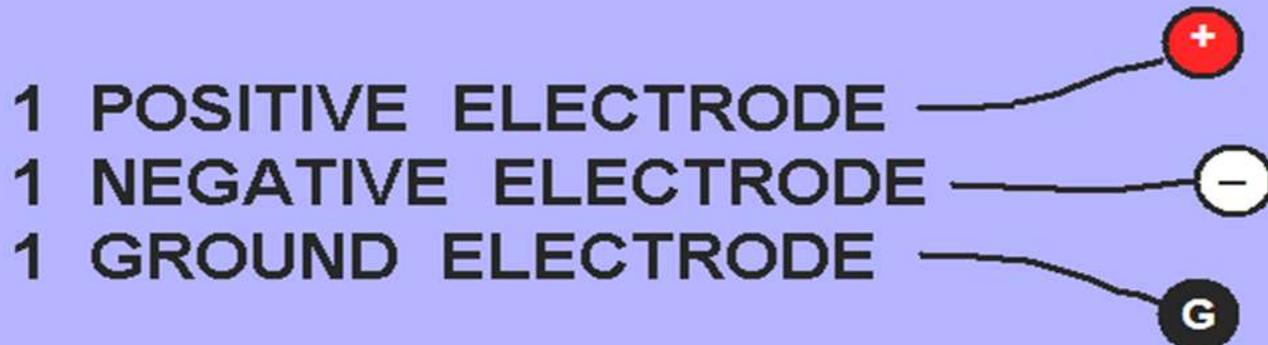

Understanding “multiple leads” ...

- Correct location of each ECG Lead
- Region of the Heart viewed by each Lead

THE ECG MACHINE

STANDARD 12 LEADS - USES 10 WIRES
(6 CHEST and 4 LIMB)

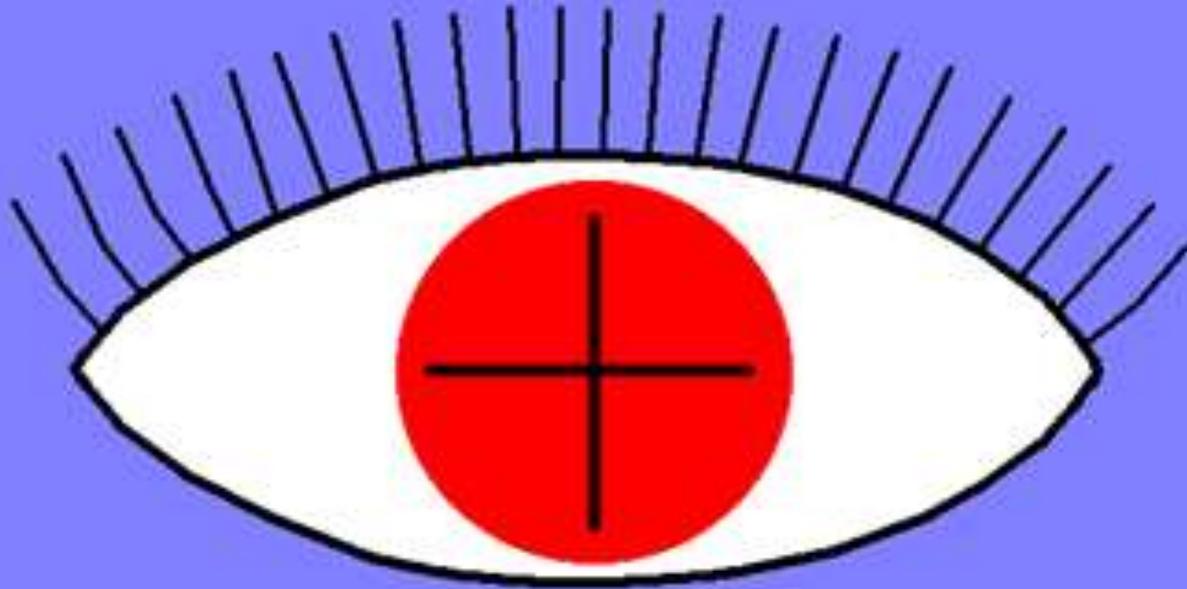

- LEADS I, II, III, and V1, V2, V3, V4, V5, V6

- LEADS AVR, AVL, and AVF

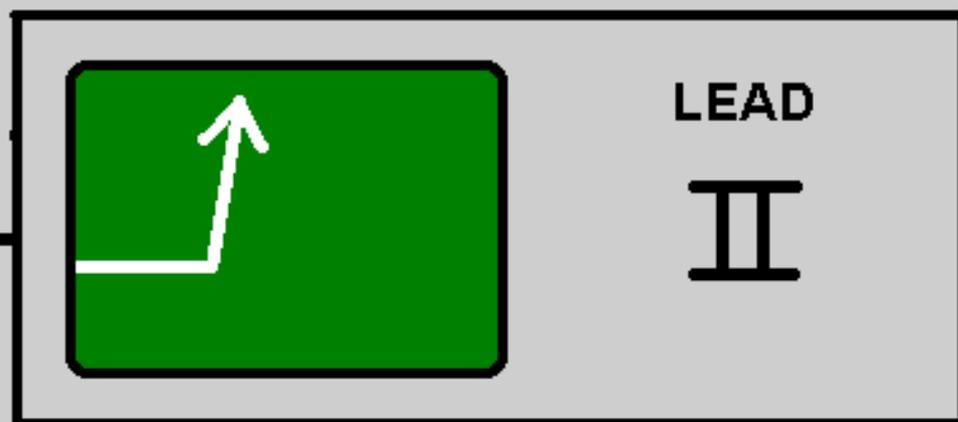

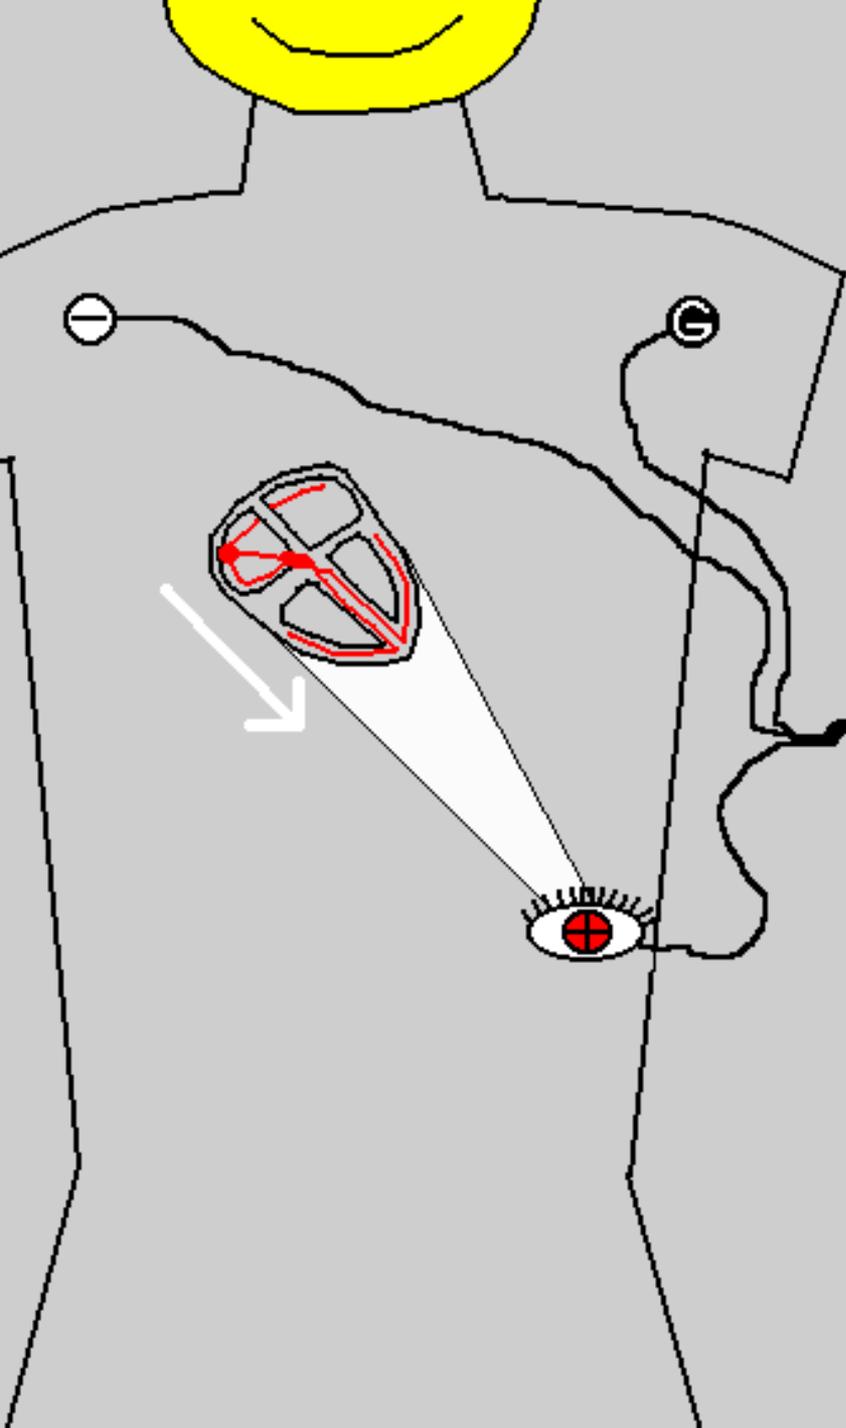

THE POSITIVE ELECTRODE

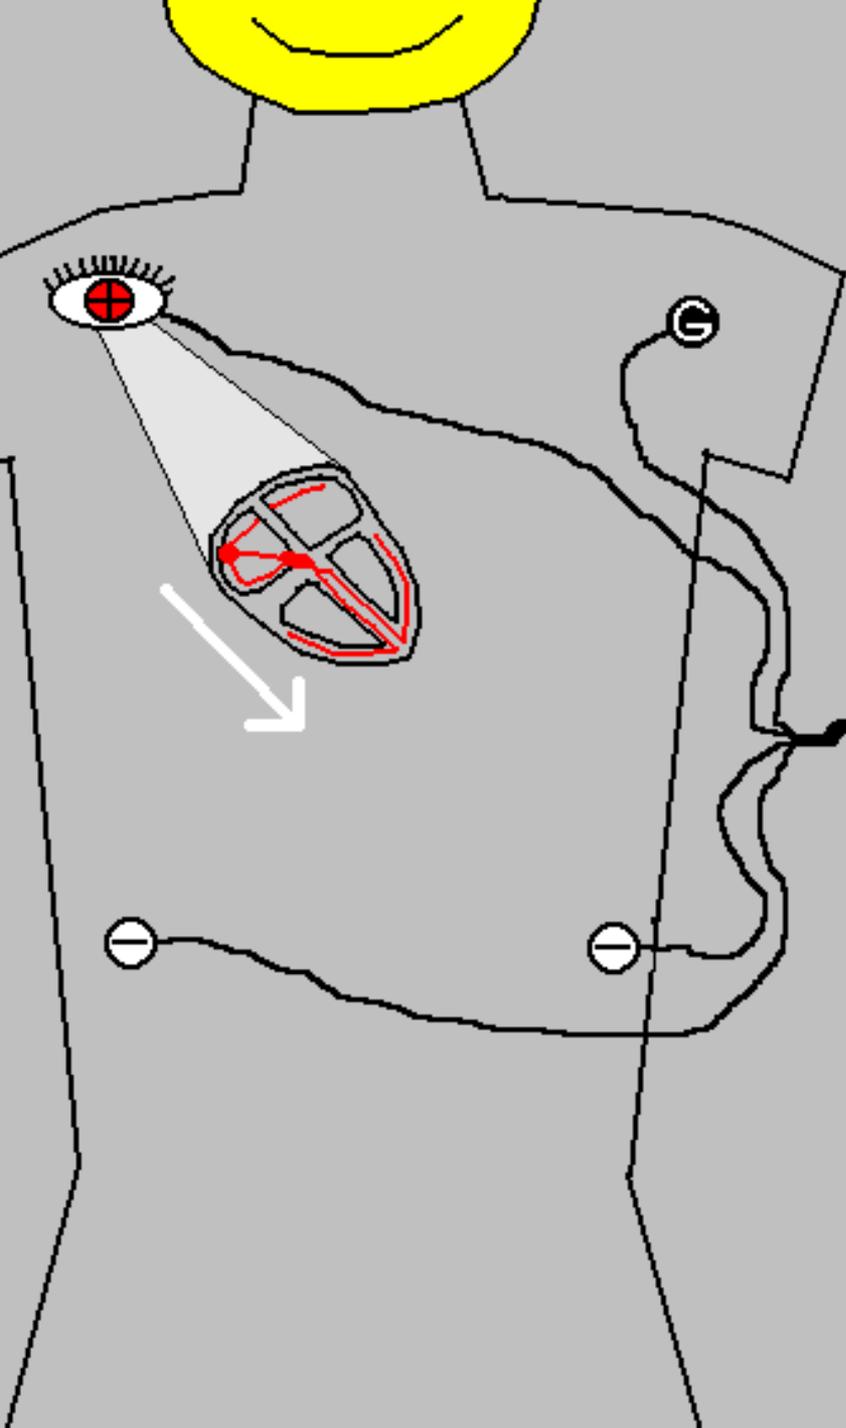

IS THE "EYE" . . .

**CURRENT MOVING
TOWARD THE EYE
(POSITIVE ELECTRODE)**

**RECORDS AN
"UPWARD"
DEFLECTION**

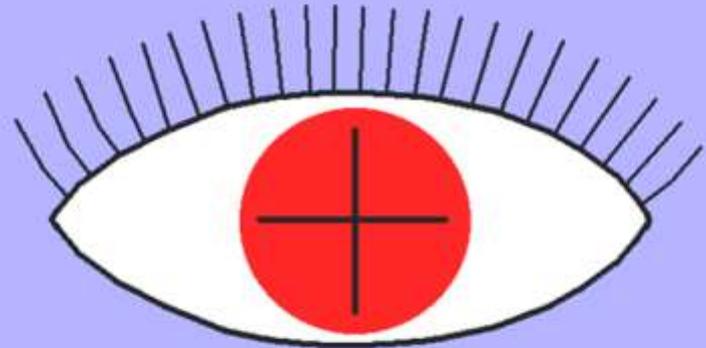

**CURRENT MOVING
AWAY FROM
THE EYE
(POSITIVE ELECTRODE)**

**RECORDS A
"DOWNWARD"
DEFLECTION**

***What part of the HEART
does each lead SEE ?***

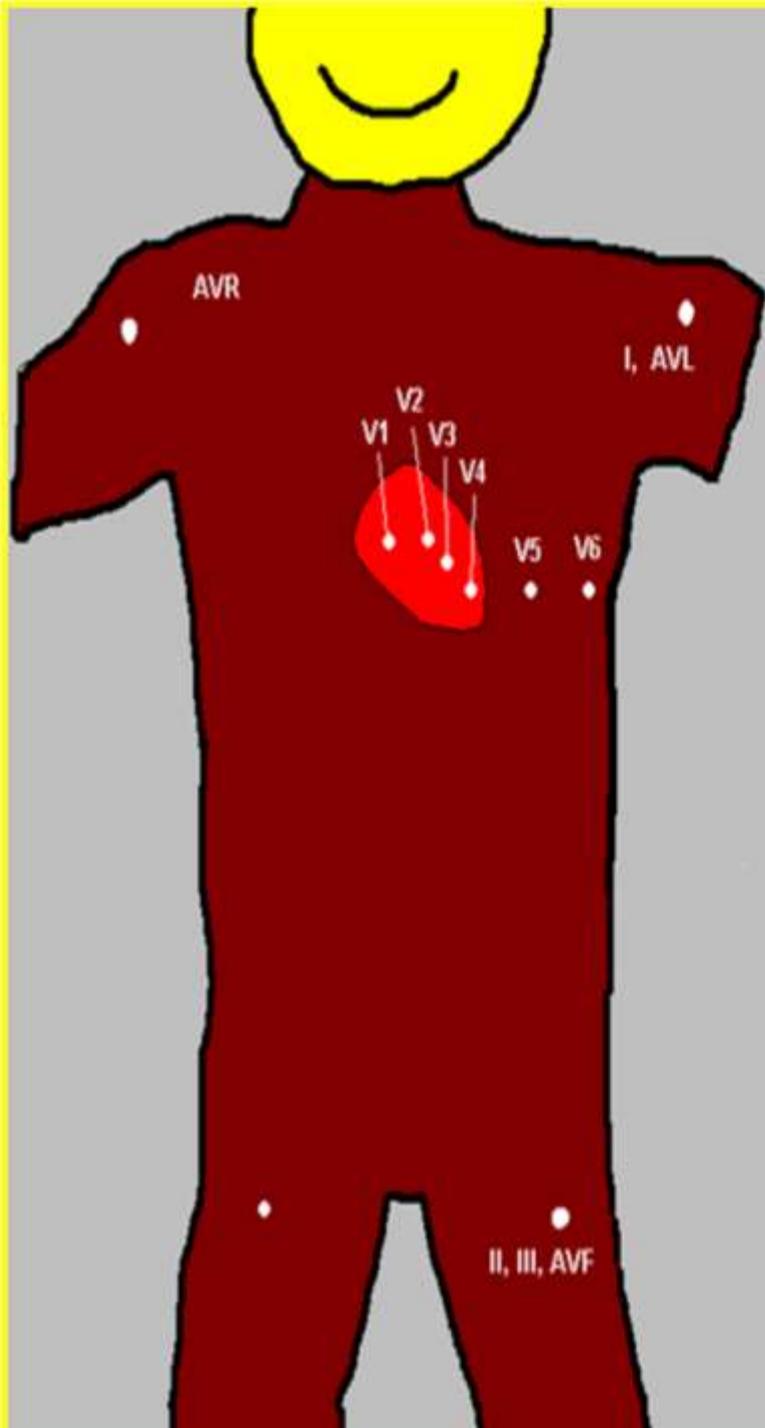

THE POSITIVE ELECTRODE

IS THE "EYE" . . .

Imagine a body made of clear glass, with only a HEART inside. We dip this body in liquid chocolate, and then scratch holes in each spot where we normally place the ECG leads

The Patient Arrives . . .

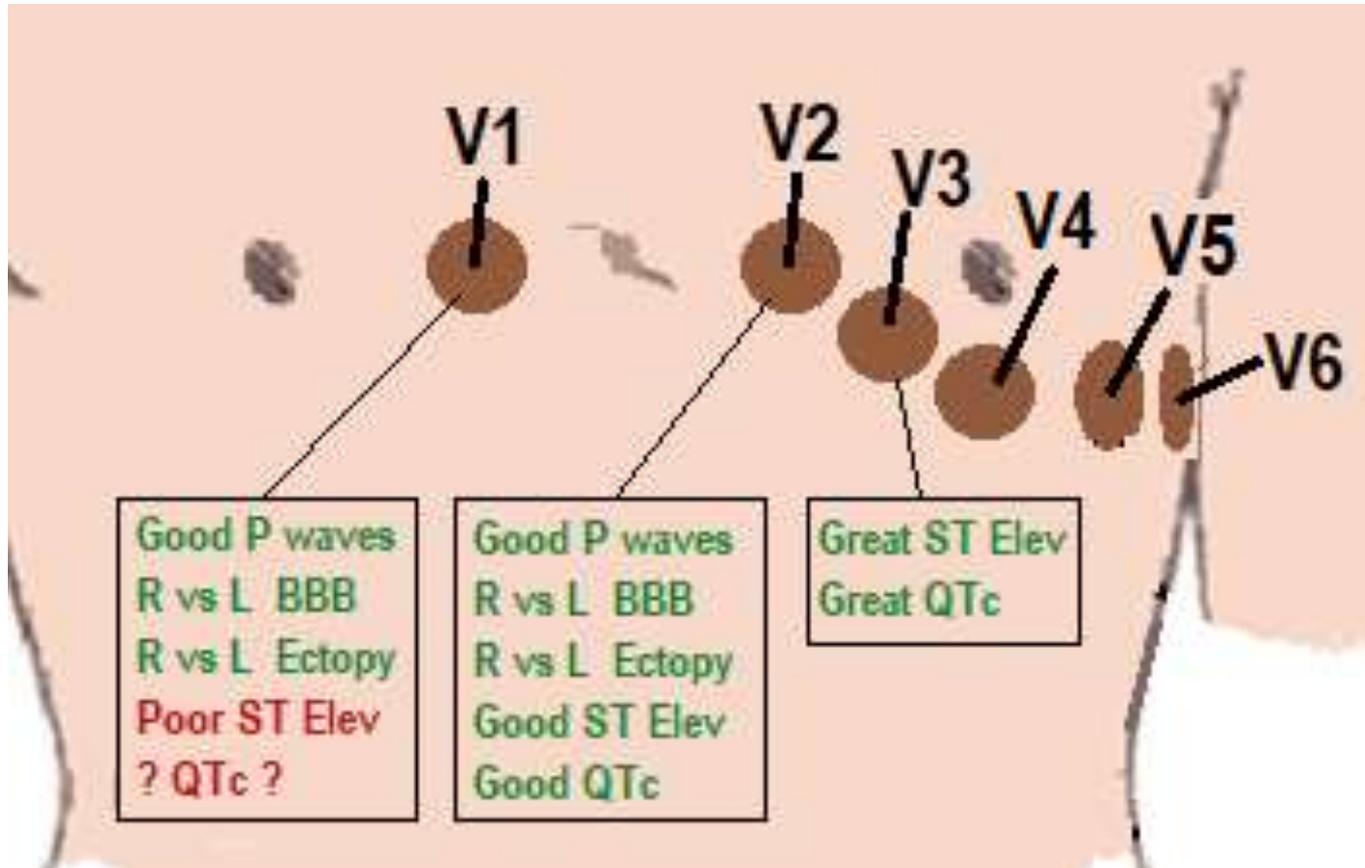

- Standard Tele / ECG hookup:
 - LEAD II
 - LEAD V2

LEAD PLACEMENT

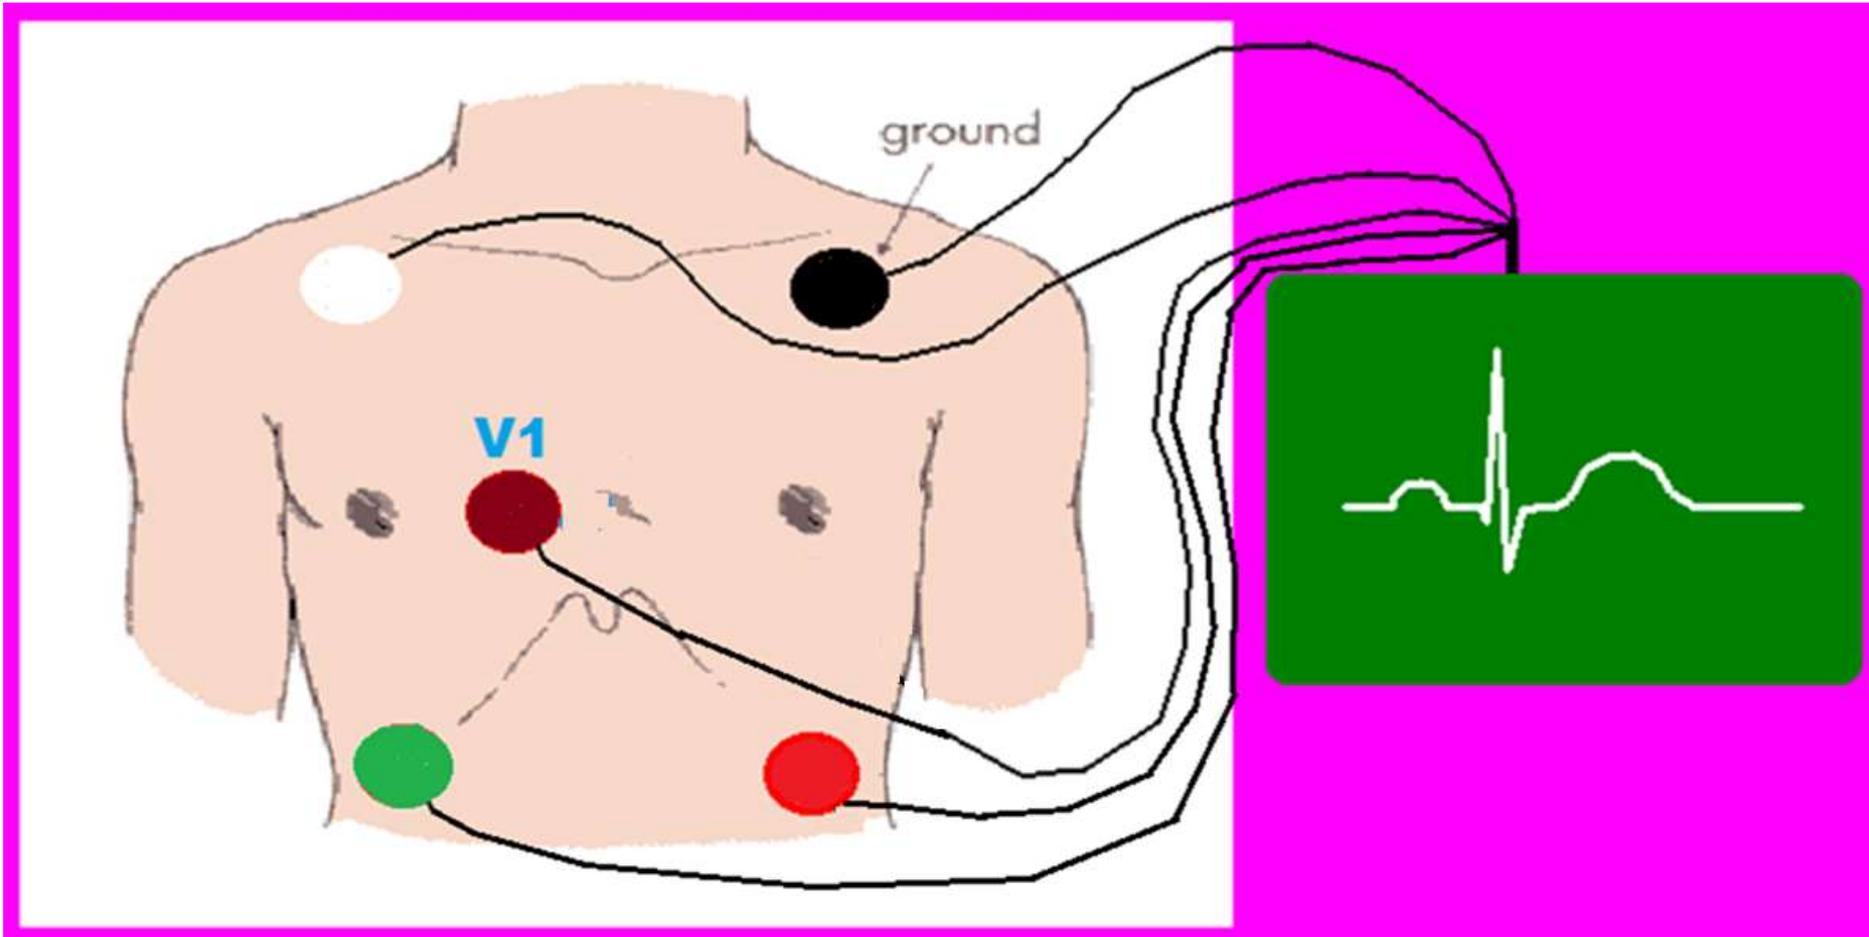

5 WIRE TELEMETRY UNIT

Lead V2 – GOOD Choice.....

Why not V1 ? (we've used V1 for years!)

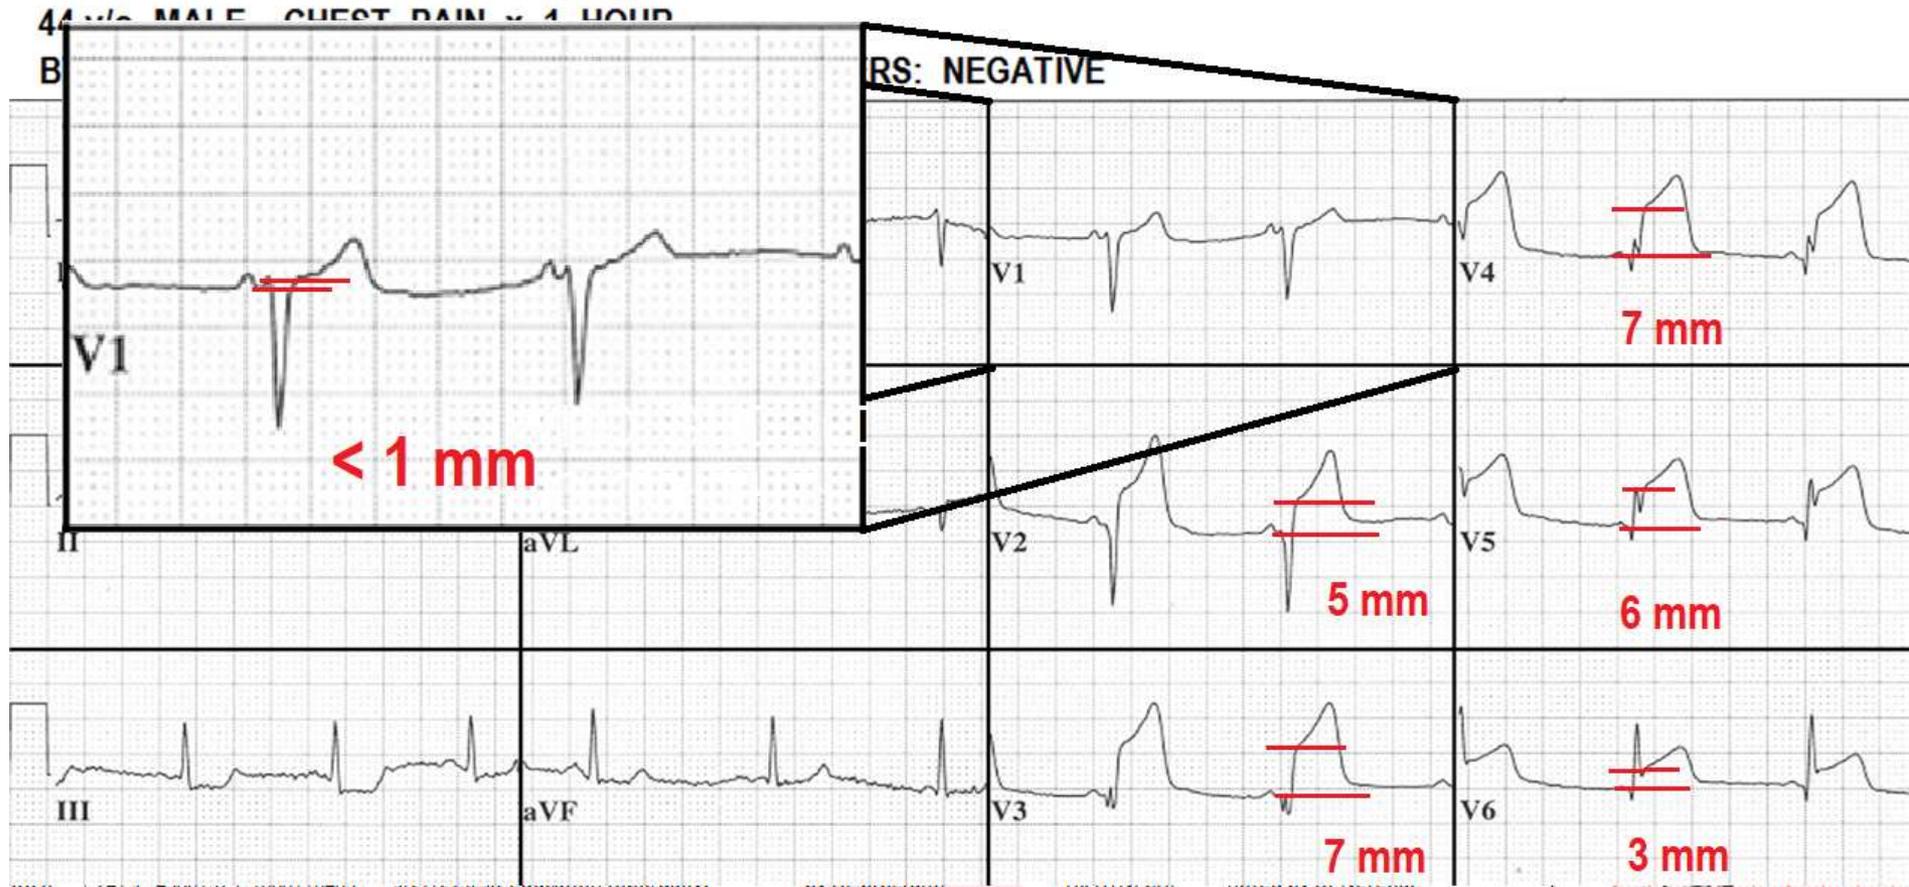

Why not V1 ? (often won't see STEMI !)

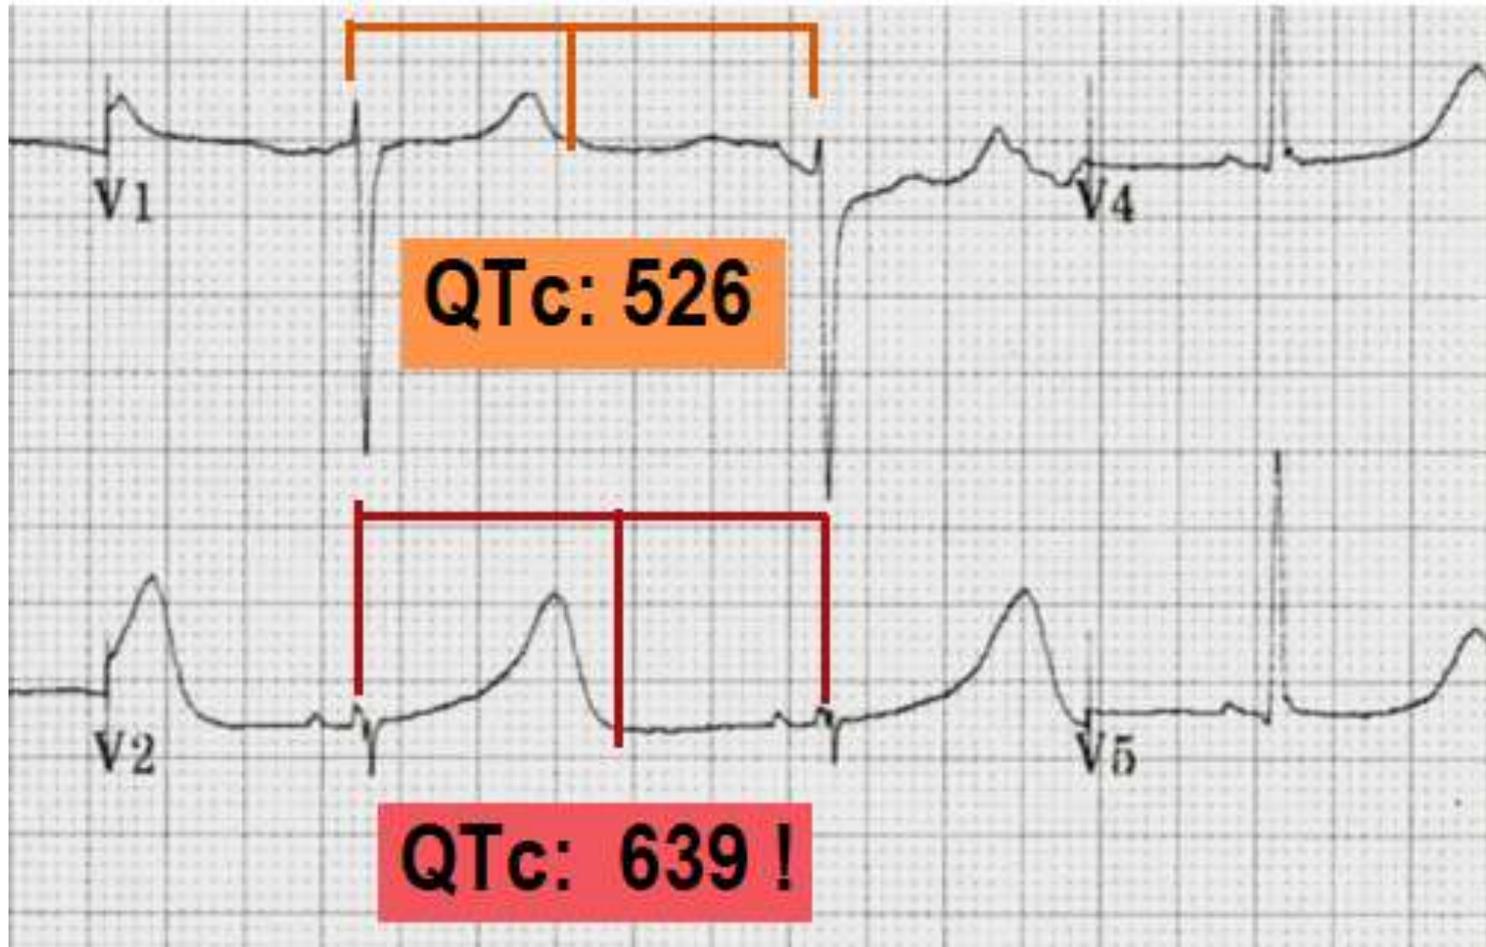

If you were only monitoring Leads II and V1, you **would NOT detect this patient's STEMI !!**

Ineffectiveness of LEAD V1 for early detection of Anteroseptal STEMI

Why not V1 ? *(may not detect critical QTc)*

The Patient Arrives . . .

- Standard Tele / ECG hookup:
 - LEAD II
 - LEAD V2
- Evaluate patient: any symptoms of ACS ?

CHIEF COMPLAINT

KEY WORDS:

“CHEST: PAIN / HEAVINESS / PRESSURE/
FUNNY FEELING IN,” etc.

SHORTNESS BREATH

DIZZINESS / LIGHTHEADEDNESS

ETC. ETC. ETC.

TYPICAL SYPTOMS of **ACUTE CORNARY SYNDROME:**

- ✓ **CHEST PAIN - DESCRIBED AS . . .**
 - "HEAVINESS, PRESSURE, DULL PAIN, TIGHTNESS"
 - CENTERED IN CHEST, SUBSTERNAL
 - MAY RADIATE TO SHOULDERS, JAW, NECK, LEFT or RIGHT ARM
 - NOT EFFECTED by:
 - MOVEMENT
 - POSITION
 - DEEP INSPIRATION

- ✓ **SHORTNESS OF BREATH**
 - MAY or MAY NOT BE PRESENT

- ✓ **NAUSEA / VOMITING**
 - MAY or MAY NOT BE PRESENT

INFARCTION

- - - "*Classic Symptoms*" - - -

QUICK ASSESSMENT "SHORT FORM"

- SUBSTERNAL CHEST PAIN**
(HAVE PATIENT POINT TO WORST PAIN)
- DESCRIBED AS "DULL PAIN,"
"PRESSURE," or "HEAVINESS"**
- DOES NOT CHANGE WITH
DEEP BREATH**

ATYPICAL SYMPTOMS of ACS

???

Acute MI patients who present without chest pain* are SHREWD:

Stroke (previous history of)

Heart failure (previous history of)

Race (non-white)

Elderly (age 75+)

Women

Diabetes mellitus

* The information listed in the table to the immediate left resulted from a study conducted by John G. Canto, MD, MSPH, et. al., of the University of Alabama. The study consisted of 434,877 patients diagnosed with AMI between 1994 and 1998 in 1,674 US hospitals. Study results were published in the Journal of the American Medical Association (JAMA) on June 28, 2000, Vol. 283, No. 24, pages 3223-3229

Common atypical complaints associated with AMI without chest pain include:

Malaise (weakness)

Fatigue

Indigestion

Abdominal pain

Nausea

Cold sweats

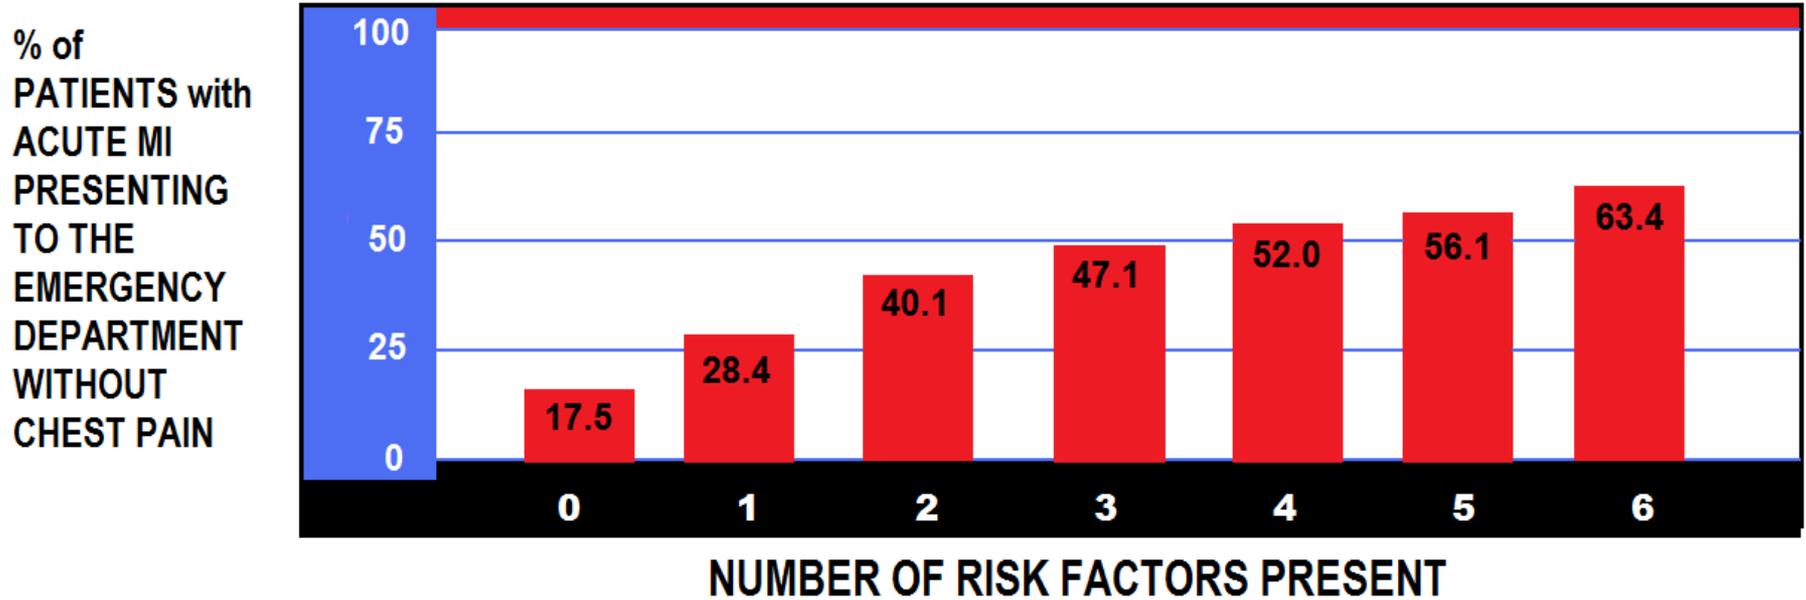

Dizziness

Elevated heart rate

Syncope

Dyspnea

Effect of Having Multiple Risk Factors for AMI Without Chest Pain

RISK FACTORS INCLUDE: **S**roke (previous), **H**ear failure (previous), **R**ace (non-white), **E**lderly (age 75+), **W**omen, **D**iabetes

DATA SOURCE: J. CANTO, MD, MSPH, et al, JAMA 2000 ; 283 : 3223 - 3229

**WOMEN'S MAJOR SYMPTOMS
PRIOR TO THEIR HEART ATTACK:**

- UNUSUAL FATIGUE 71 %
- SLEEP DISTURBANCE 48 %
- SOB 42 %
- INDIGESTION 39 %
- ANXIETY 36 %

APPROXIMATELY 78 % OF WOMEN REPORTED EXPERIENCING AT LEAST ONE OF THESE SYMPTOMS FOR MORE THAN ONE MONTH EITHER DAILY OR SEVERAL TIMES PER WEEK PRIOR TO THEIR MI.

**WOMEN'S MAJOR SYMPTOMS
DURING THEIR HEART ATTACK:**

- SHORTNESS OF BREATH 58 %
- WEAKNESS 55 %
- UNUSUAL FATIGUE 43 %
- COLD SWEAT 39 %
- DIZZINESS 39 %

43 % HAD NO CHEST PAIN AT ANY TIME DURING THEIR MI!

Circulation, 2003;108;2619-2623

Physical Exam – Clues of MI:

- Skin may be PALE, CLAMMY
- **SWEATING !** (Diaphoresis)
- Clutching /Rubbing chest
- BP can be high, normal or low
- Anxiety / “look of impending doom.”

The Patient Arrives . . .

- Standard Tele / ECG hookup:
 - LEAD II
 - LEAD V2
- Evaluate patient: any symptoms of ACS ?
- Review 12 Lead ECG. Look for:
 - Signs of ischemia
 - QT prolongation

Evaluating the ECG for ACS:

A TWO-STEP process:

Evaluating the ECG for ACS:

A TWO-STEP process:

STEP 1: Evaluate QRS Width

Evaluating the ECG for ACS:

A TWO-STEP process:

STEP 1: Evaluate QRS Width

**STEP 2: Evaluate J Points, ST-Segment and T waves
in EVERY Lead**

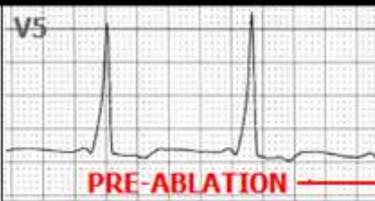

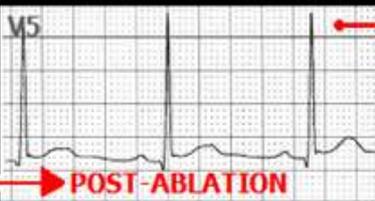

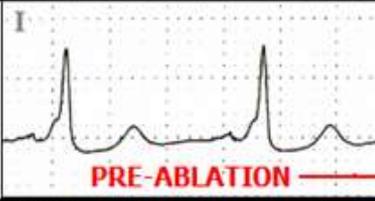

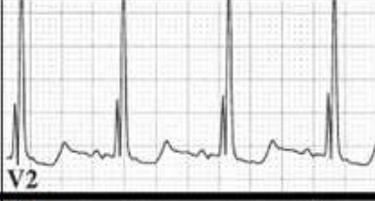

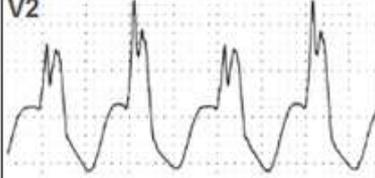

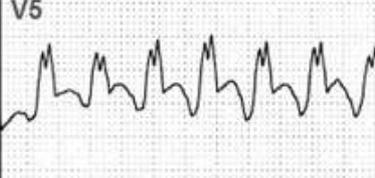

STEP 1 – evaluate QRS width:

- **QRS is ABNORMALLY WIDE (>120 ms),**
 - **indicates DEPOLARIZATION ABNORMALITY**
(e.g. “bundle branch block, Wolff-Parkinson-White Syndrome, etc).

STEP 1 – evaluate QRS width:

- QRS is **ABNORMALLY WIDE (>120 ms)**,
 - indicates **DEPOLARIZATION ABNORMALITY** (e.g. “bundle branch block, Wolff-Parkinson-White Syndrome, etc).
 - **DEPOLARIZATION ABNORMALITIES** in turn cause **REPOLARIZATION ABNORMALITIES**, which alters the: *J Points, ST-Segments and/or T Waves.*

CONDITIONS THAT INCREASE QRS DURATION RESULT IN SECONDARY REPOLARIZATION ABNORMALITIES:

<p>RIGHT BUNDLE BRANCH BLOCK</p>			<p>LEFT BUNDLE BRANCH BLOCK</p>
<p>W-P-W BYPASS TRACT, LEFT LATERAL WALL 49 y/o MALE</p>	 <p style="text-align: center; color: red;">PRE-ABLATION</p>	 <p style="text-align: center; color: red;">POST-ABLATION</p>	<p>SAME PATIENT AS ON LEFT - IMMEDIATELY AFTER RF ABLATION OF BYPASS TRACT</p>
<p>W-P-W BYPASS TRACT, RIGHT ANTERIOR/ LATERAL WALL 14 y/o MALE</p>	 <p style="text-align: center; color: red;">PRE-ABLATION</p>	 <p style="text-align: center; color: red;">POST-ABLATION</p>	<p>SAME PATIENT AS ON LEFT - IMMEDIATELY AFTER RF ABLATION OF BYPASS TRACT</p>
<p>PACEMAKER - RIGHT VENTRICULAR APEX</p>			<p>PACEMAKER TURNED OFF HERE</p>
<p>RIGHT VENTRICULAR HYPERTROPHY (Strain Pattern)</p>			<p>LEFT VENTRICULAR HYPERTROPHY (Strain Pattern)</p>
<p>VENTRICULAR TACHYCARDIA FOCUS: LEFT FASCICULAR, 17 y/o FEMALE</p>			<p>VENTRICULAR TACHYCARDIA- FOCUS: RIGHT VENTRICULAR APEX</p>

**Wide QRS present:
QRSd > 120ms**

- **Determine RIGHT vs. LEFT Bundle Branch Block Pattern**

Simple "Turn Signal Method" . . .

THE "TURN SIGNAL METHOD" for identifying BUNDLE BRANCH BLOCK

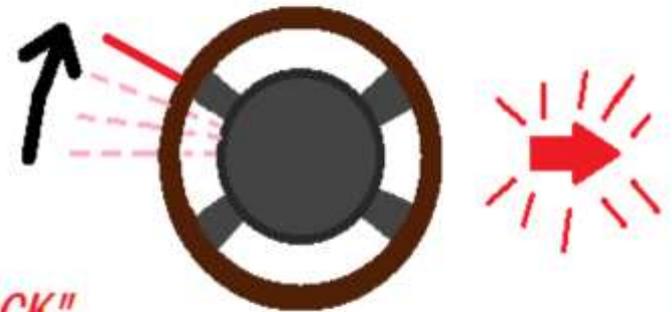

V1

USE LEAD V1 for this technique

To make a **RIGHT TURN**
you push the turn signal lever **UP**

THINK:

"QRS points UP = RIGHT BUNDLE BRANCH BLOCK"

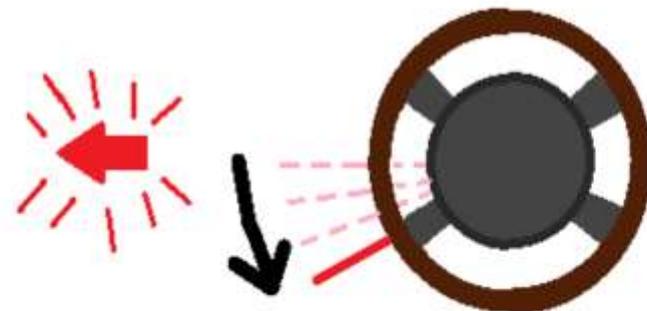

V1

To make a **LEFT TURN**
you push the turn signal lever **DOWN**

THINK:

"QRS points DOWN = LEFT BUNDLE BRANCH BLOCK"

DIAGNOSING BUNDLE BRANCH BLOCK

USING LEADS V1, V2, and V5, V6:

LOCATING RsR' or RR' COMPLEXES:

V1

V2

**RIGHT BUNDLE
BRANCH BLOCK**

V5

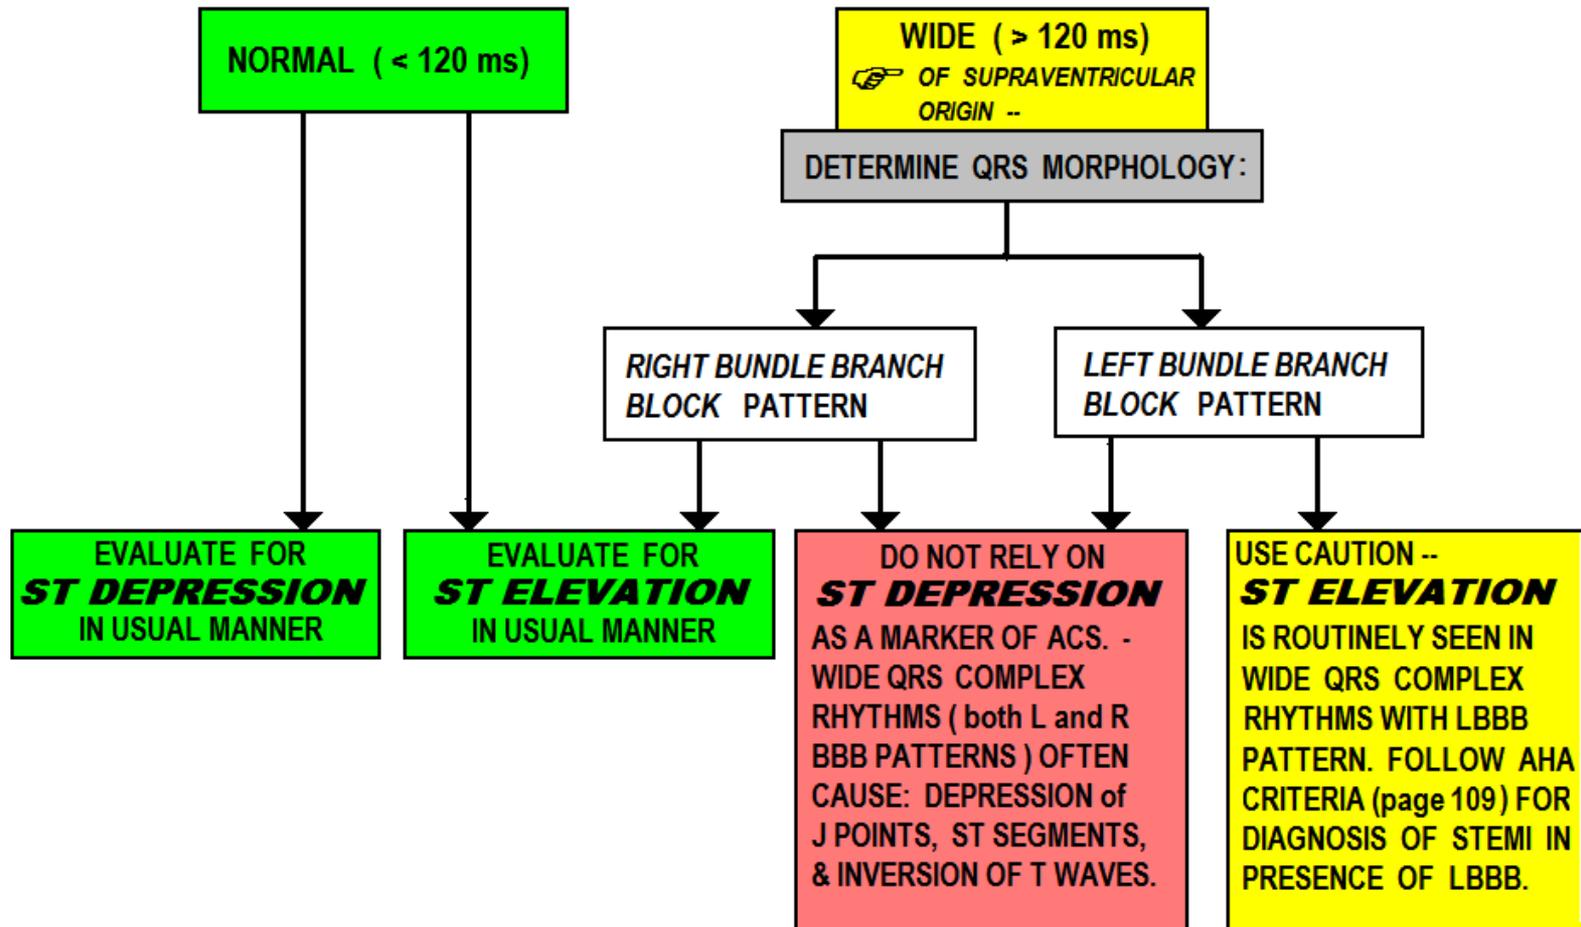

V6

**LEFT BUNDLE
BRANCH BLOCK**

Evaluating the ECG for ACS:

STEP 1 - EVALUATE WIDTH OF QRS:

Wide QRS present: (QRSd > 120ms)

- **When RIGHT Bundle Branch Block pattern is present:**
 - **Precordial Leads typically demonstrate ST Depression and T wave Inversion**

74 years		Vent. rate	72 bpm	Normal sinus rhythm
Male	Caucasian	PR interval	186 ms	Left axis deviation
		QRS duration	166 ms	Right bundle branch block
Room:		QT/QTc	436/477 ms	Inferior infarct, age undetermined
Loc: 0	Opt:	P-R-T axes	57 -32 32	Abnormal ECG

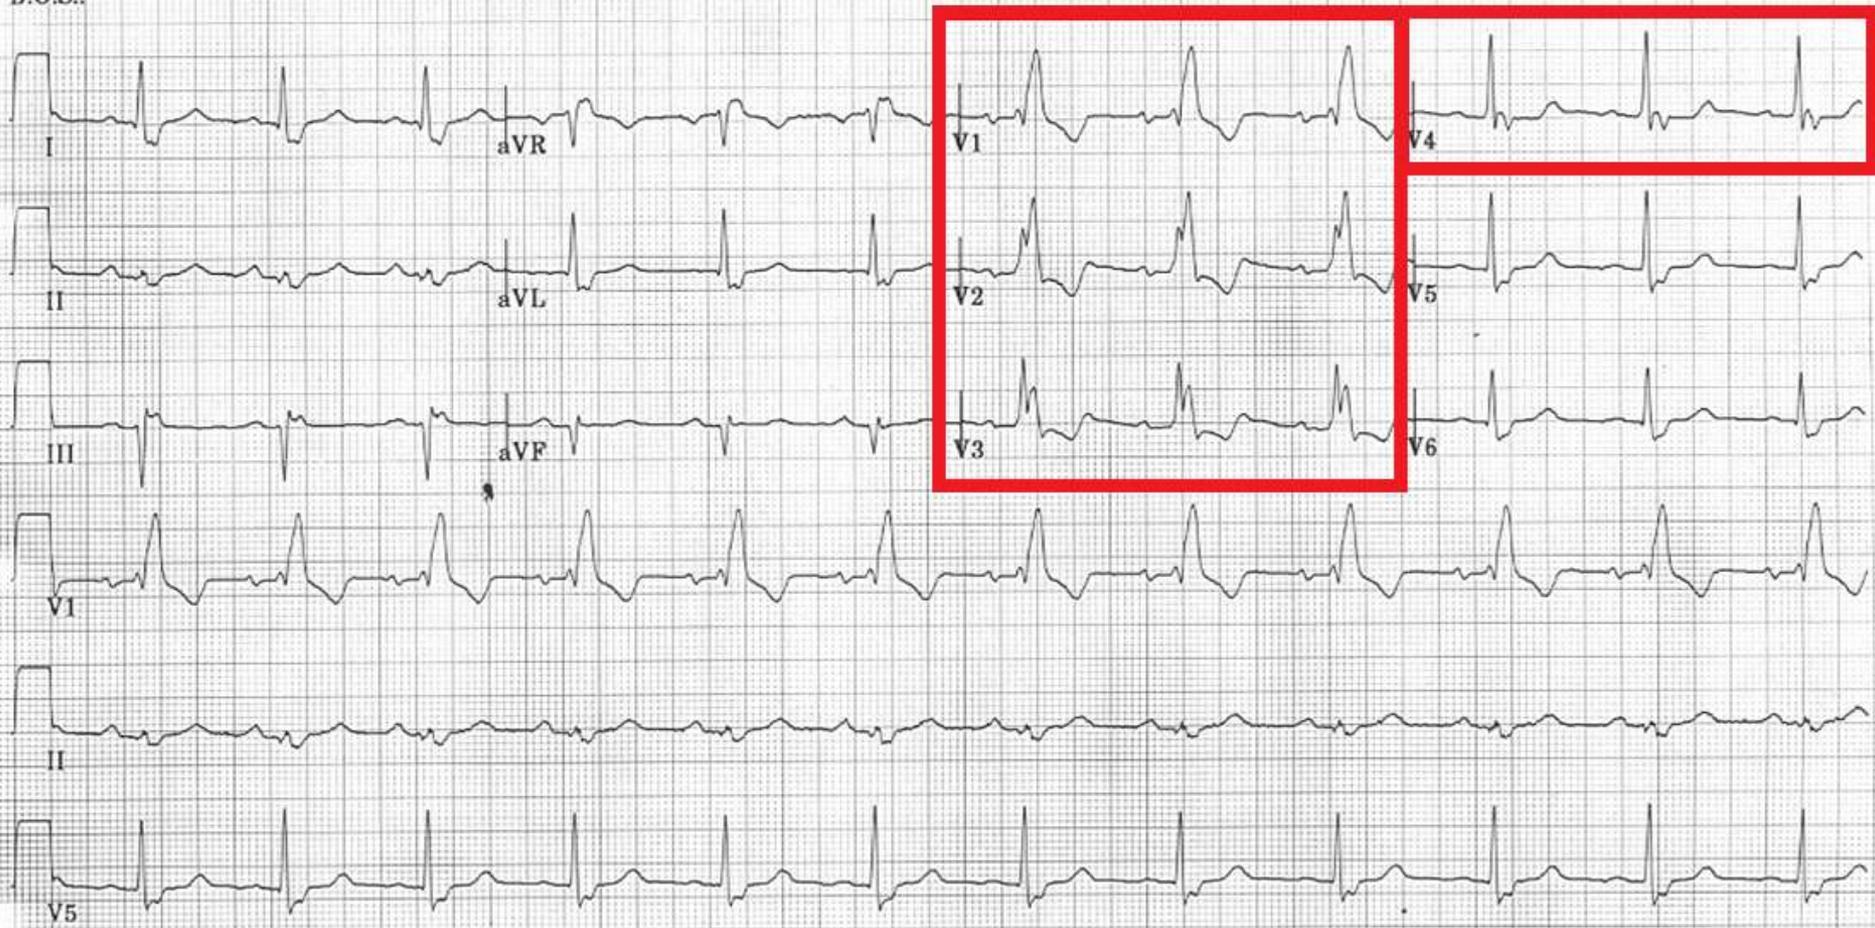

RBBB causes ST Depression, T Wave Inversion, ANTERIOR Leads (V1 - V4).

HELPFUL INDICATORS FOR ECG DIAGNOSIS OF STEMI in the presence of LBBB:

- ST ELEVATION $>$ 5 mm
- COMPARE J POINT, ST SEGMENTS and T WAVES of previous ECG with LBBB to NEW ECG.
- CONVEX ST SEGMENT = poss. MI
CONCAVE ST SEGMENT = normal
- CONCORDANT ST changes (1 mm or $>$ ST DEPRESSION V1 - V3 or ST ELEVATION LEADS II, III, AVF)
- ST ELEVATION in LEADS II, III, and/or AVF

“Electrocardiographic Diagnosis of Evolving Acute Myocardial Infarction in the Presence of Left Bundle-Branch Block” Birnbaum et al, N Engl J Med 1996; 334:481-487

Be advised that in patients with

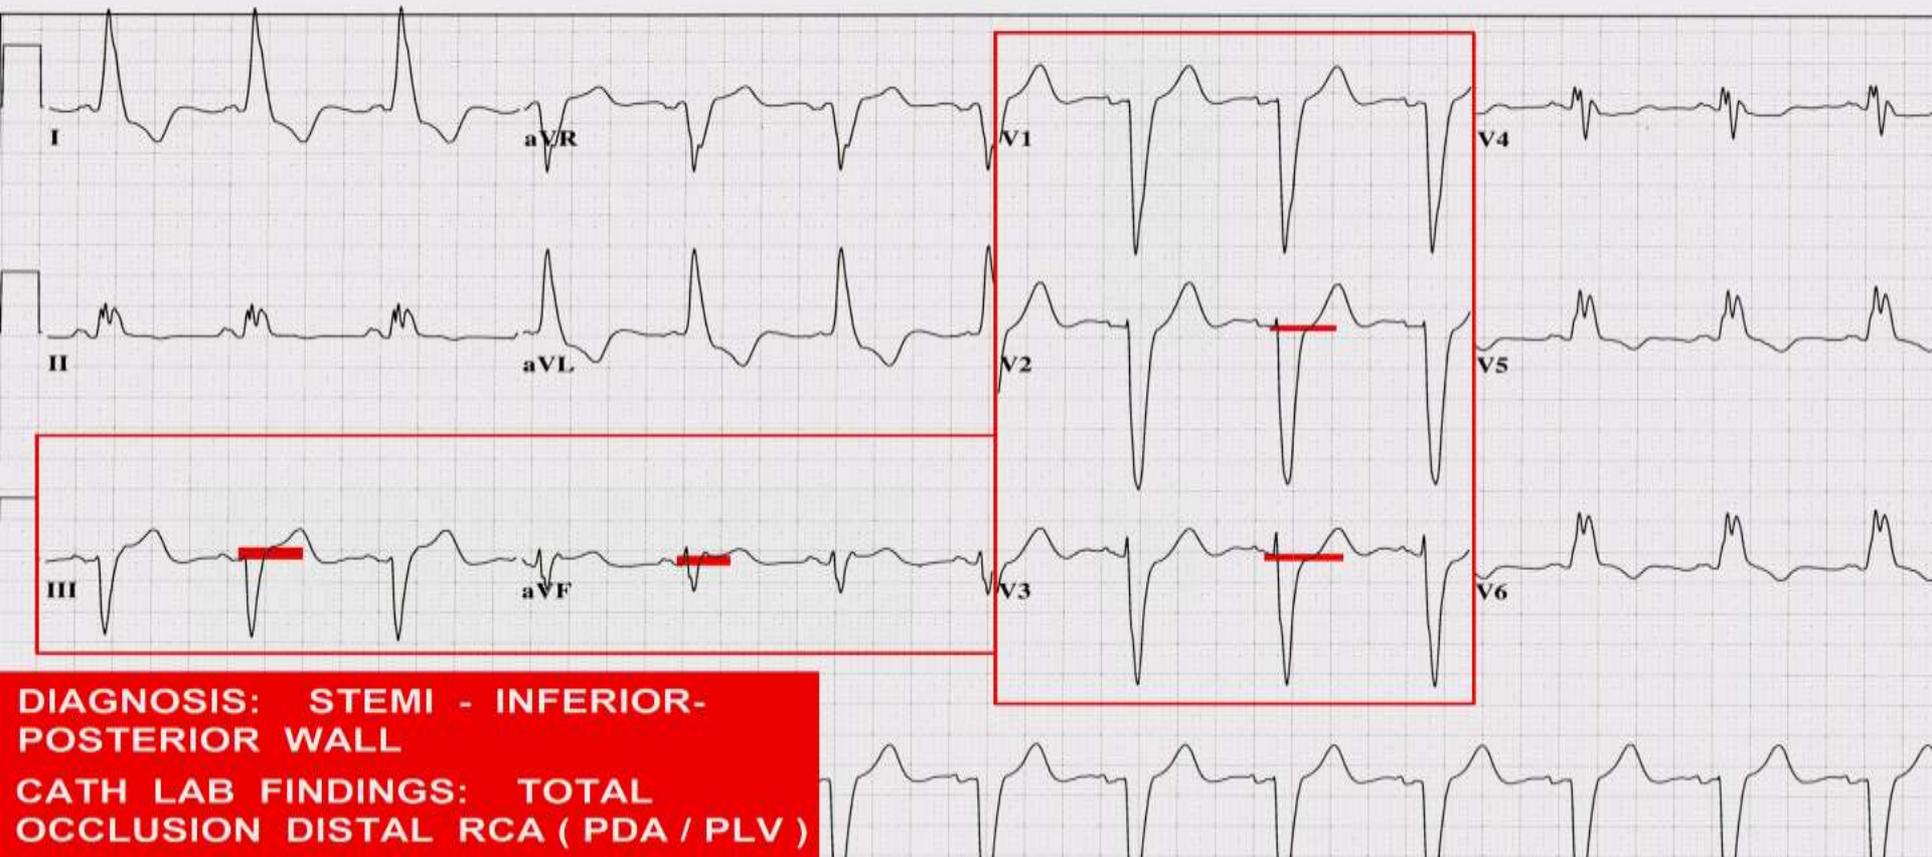

**Left Bundle Branch Block
Combined with
Ventricular Hypertrophy,**

*The J Point elevation can exceed 0.5 mv
(5mm) above the iso-electric line in patients
without ACS.*

Evaluating the ECG for ACS:

STEP 1 - EVALUATE WIDTH OF QRS:

Evaluating the ECG for ACS:

Patients with Normal Width QRS (QRSd < 120ms)

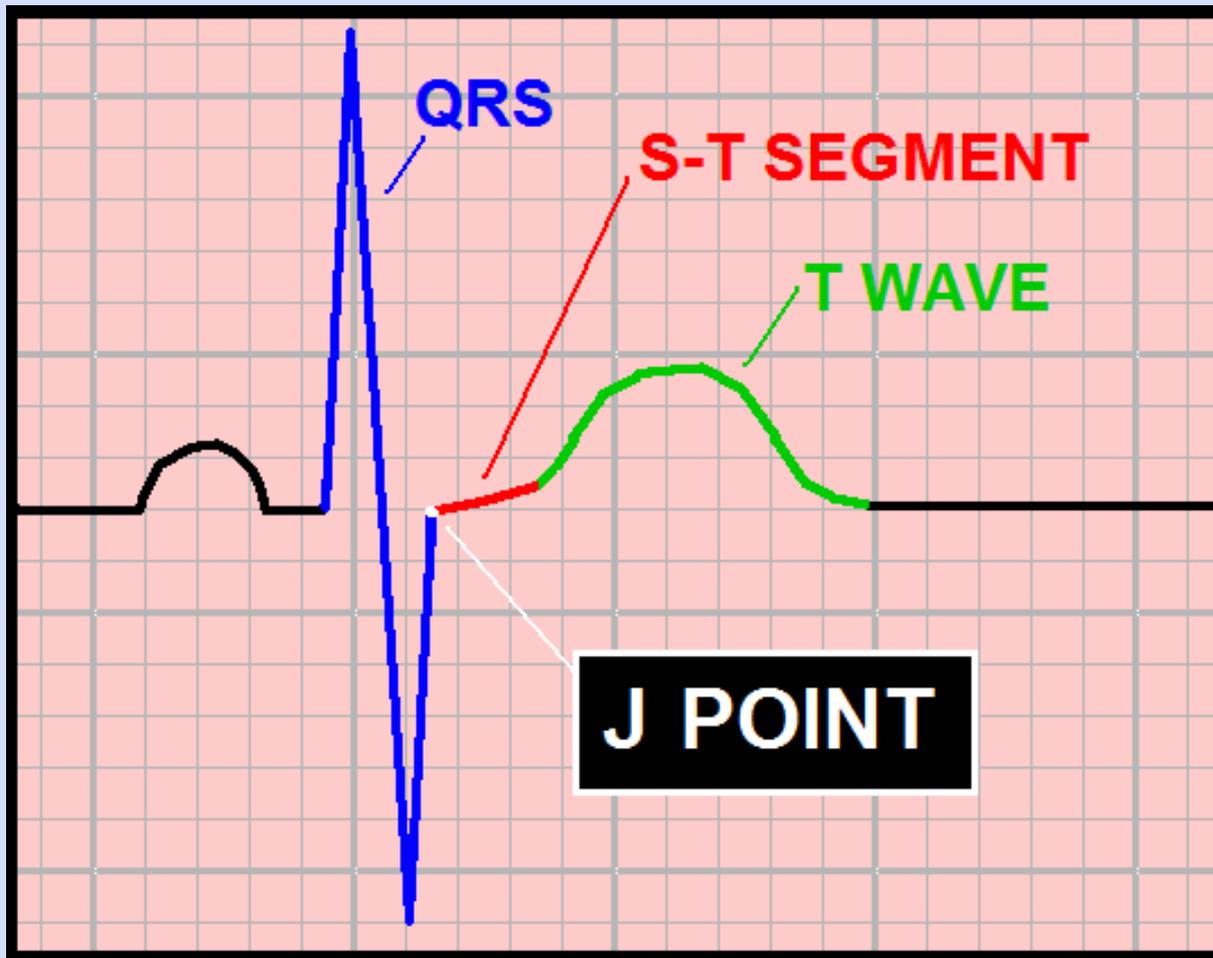

STEP 2 - EVALUATE the EKG for ACS

THE EKG MARKERS USED FOR DETERMINING THE PRESENCE OF ACUTE CORONARY SYNDROME INCLUDE:

- J POINTS
- ST SEGMENTS
- T WAVES

CAREFULLY SCRUTINIZE THESE MARKERS IN EVERY LEAD OF THE 12 LEAD EKG, TO DETERMINE IF THEY ARE *NORMAL* or *ABNORMAL*.

Defining NORMAL:

THE J POINT SHOULD BE ..

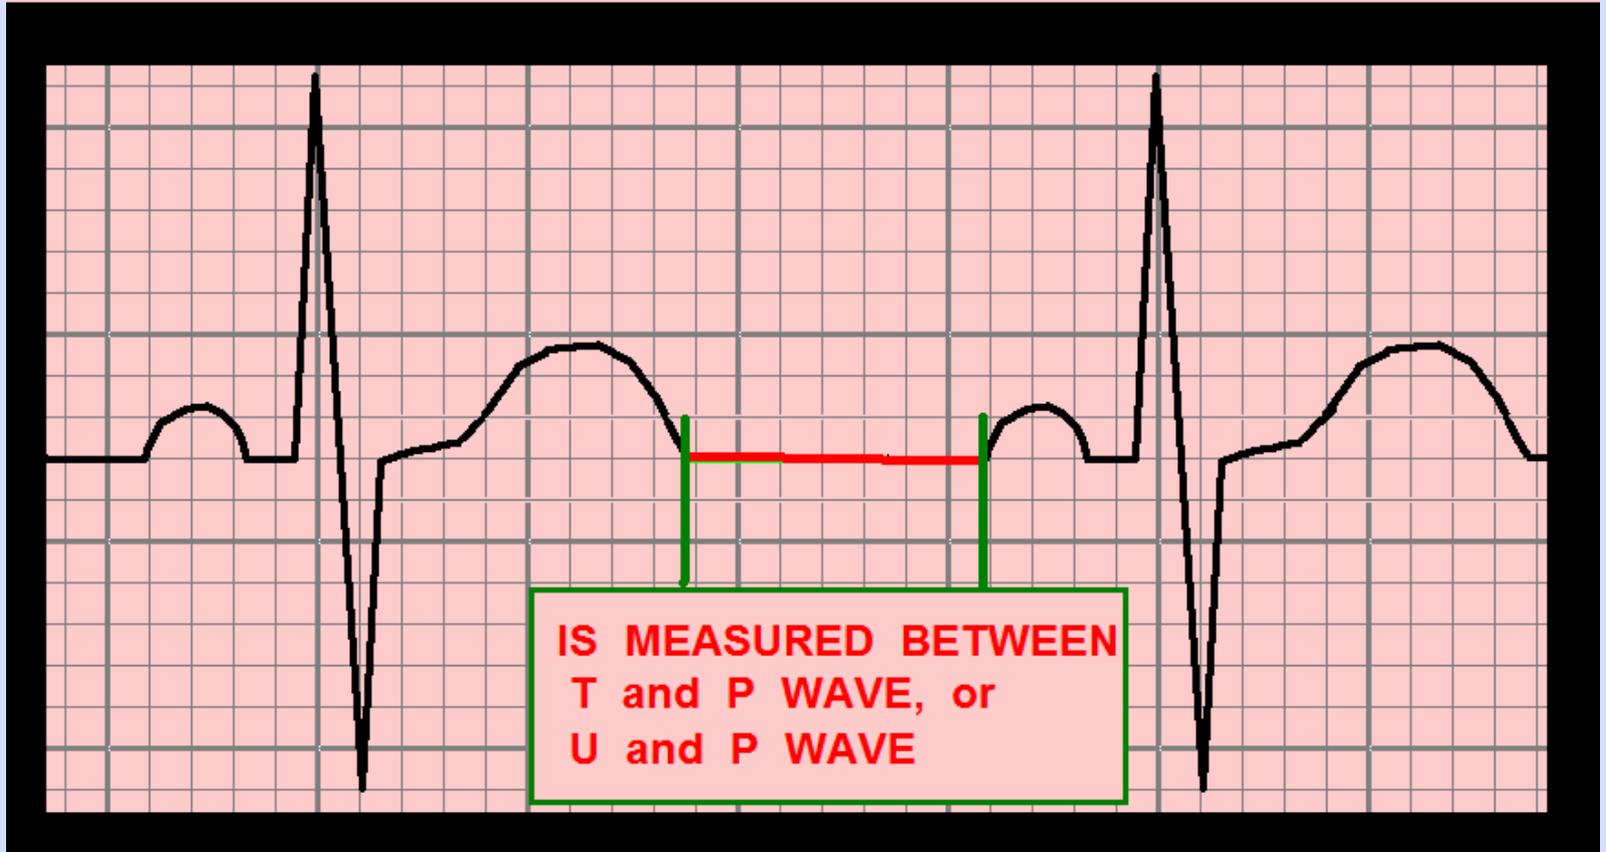

WITHIN
1 mm
ABOVE

OR

BELOW
the
ISOELECTRIC
LINE

THE ISOELECTRIC LINE

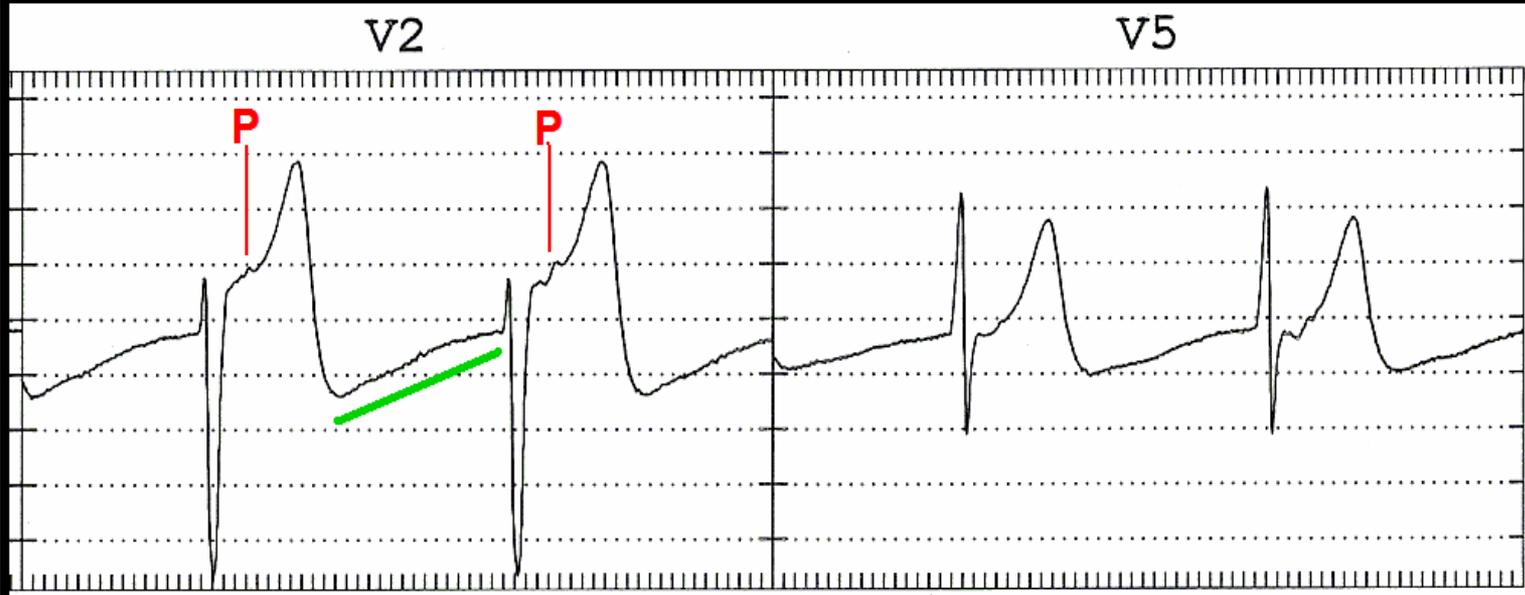

. . .the “flat line” between ECG complexes,
when there is no detectable electrical
activity . . .

The Isoelectric Line - *it's not always isoelectric !*

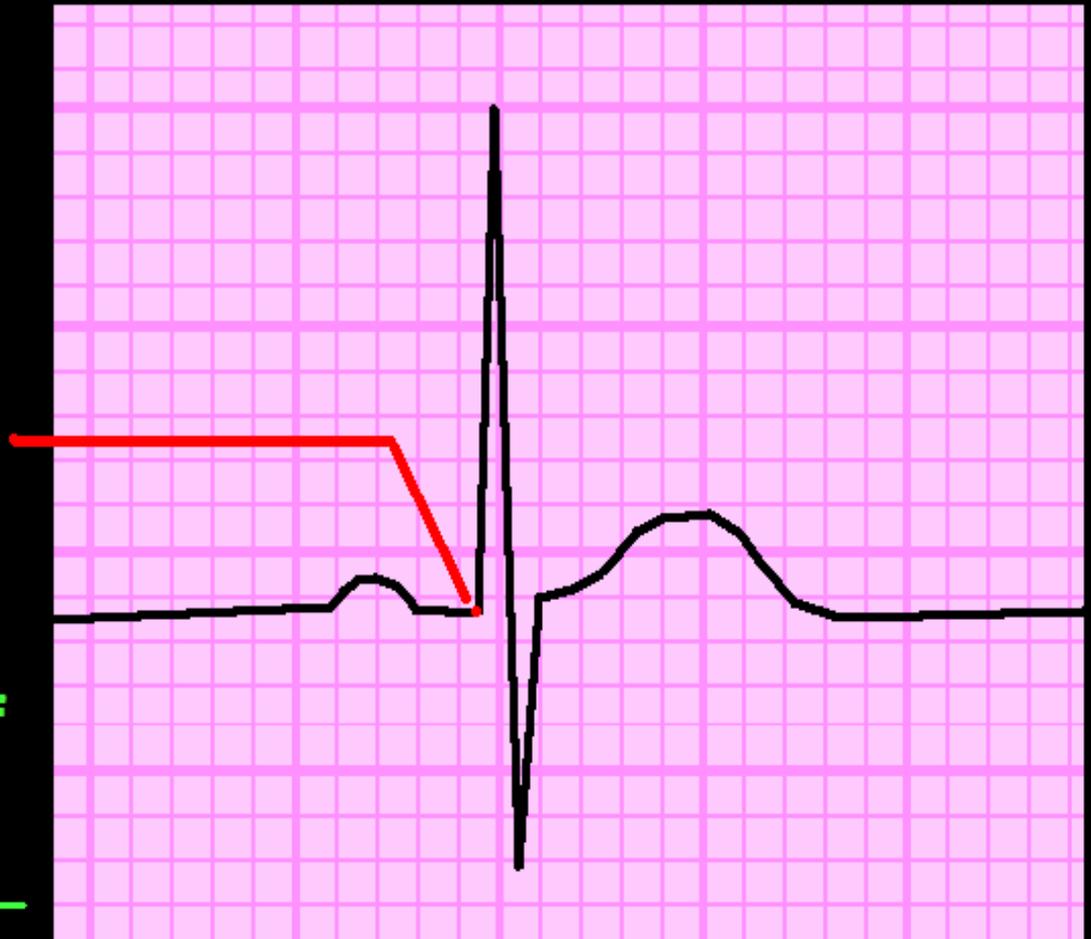

THE ISOELECTRIC LINE

EKG from 13 y/o girl in ACCELERATED JUNCTIONAL RHYTHM.
note: upsloping T-P interval, and P buried in T waves.

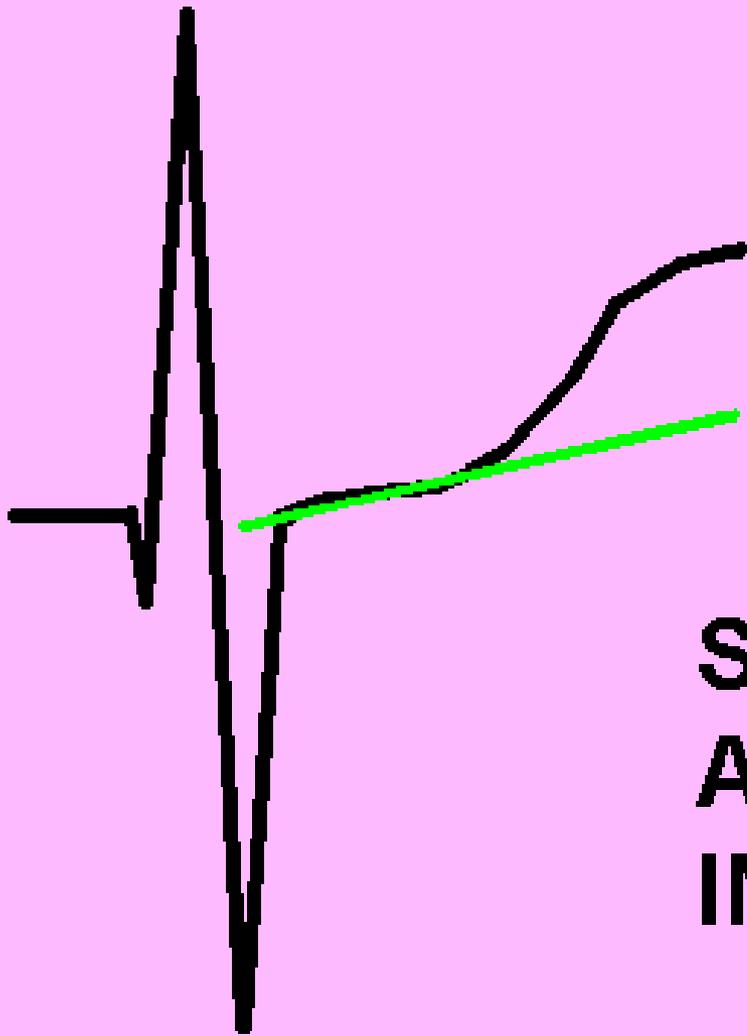

THE P-Q JUNCTION

. . . is the POINT where the P-R SEGMENT ends and the QRS COMPLEX BEGINS. Used for POINT OF REFERENCE for measurement of the J-POINT and the S-T SEGMENT –

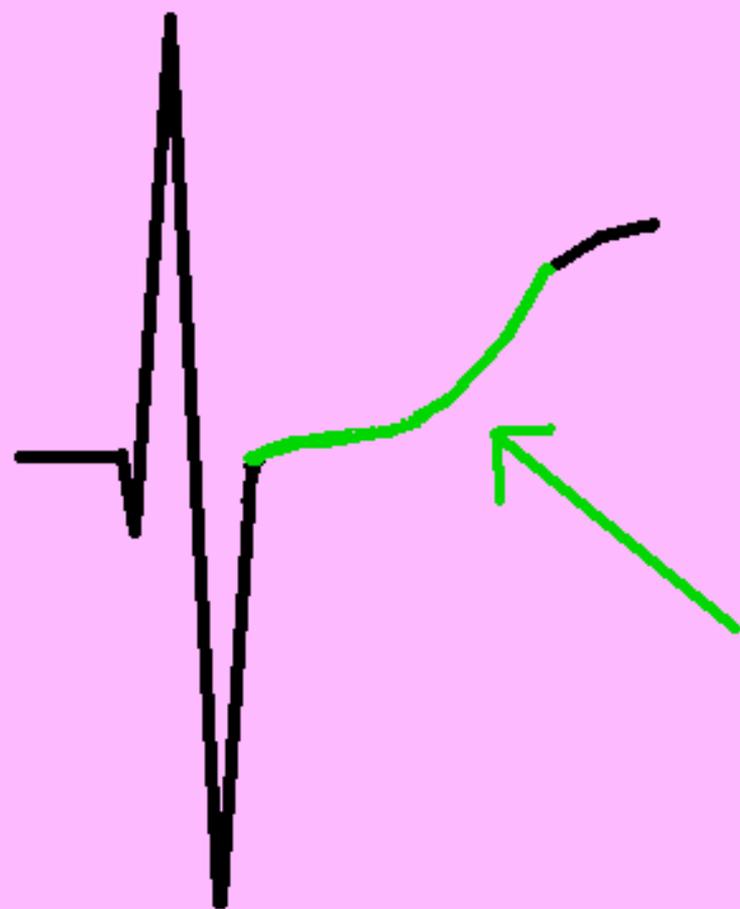

— as per the A.H.A., A.C.C., and WANG, ASINGER, and MARRIOTT, N.E.J.M. vol. 349:2128-2135 Nov. 27, 2003

THE S-T SEGMENT

SHOULD HAVE
A "SLIGHT POSITIVE"
INCLINATION

THE S-T SEGMENT

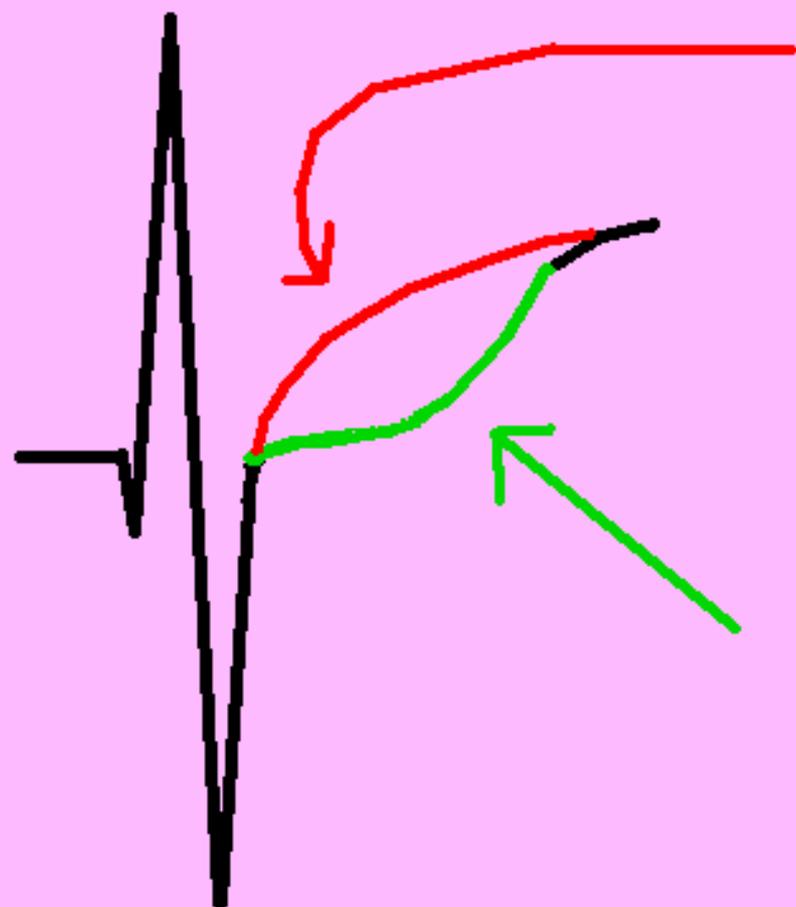

SHOULD BE
"CONCAVE" IN
SHAPE . . .

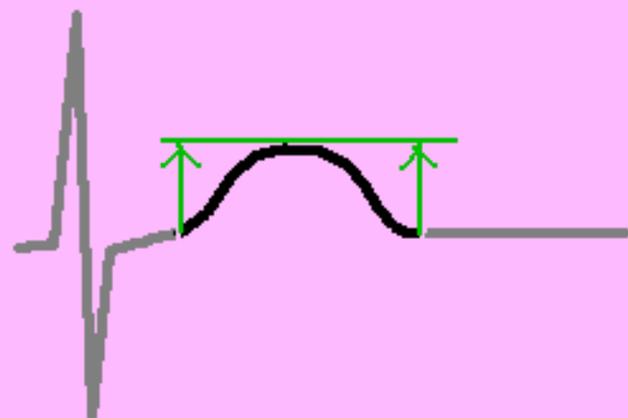

THE S-T SEGMENT

AS OPPOSED TO
"CONVEX" IN
SHAPE

SHOULD BE
"CONCAVE" IN
SHAPE . . .

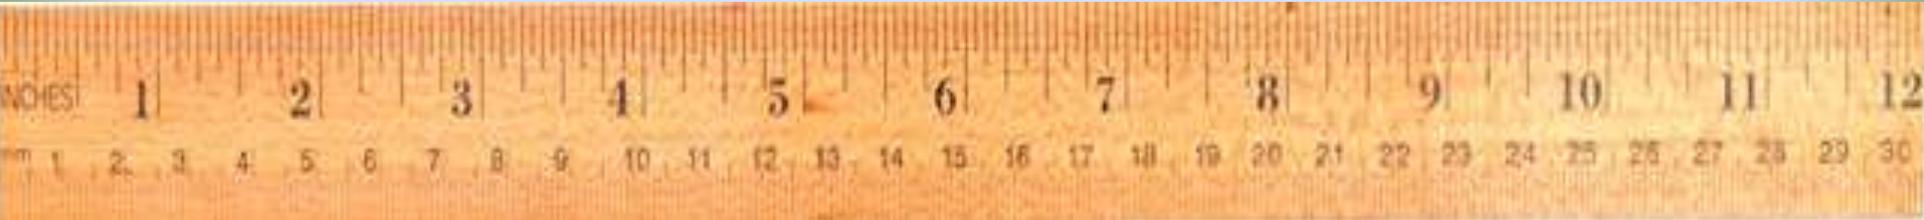

THE T WAVE

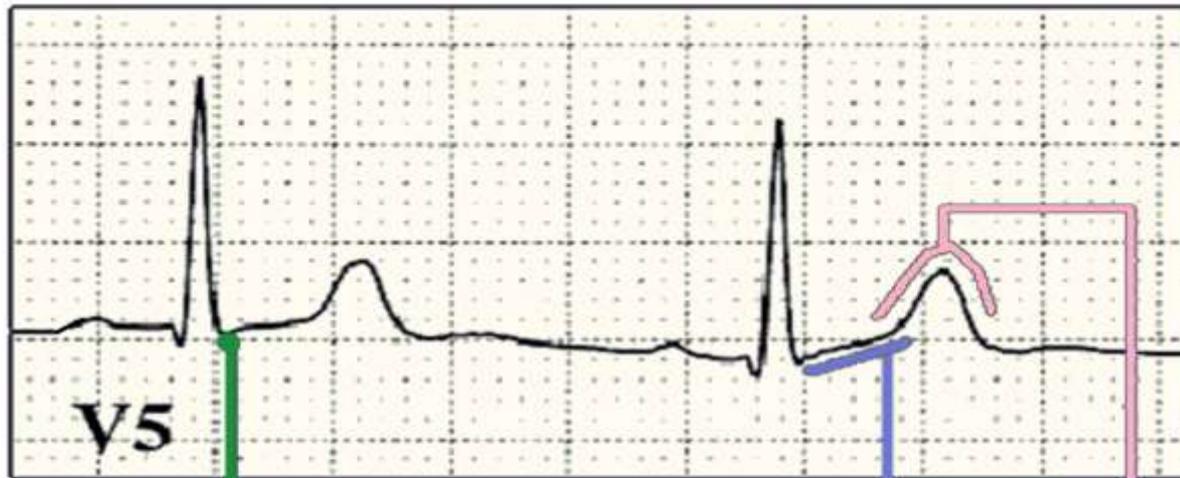

AMPLITUDE GUIDELINES:

- IN THE LIMB LEADS, SHOULD BE LESS THAN 1.0 mv (10 mm)
- IN THE PRECORDIAL LEADS, SHOULD BE LESS THAN 0.5 mv (5 mm)
- SHOULD NOT BE TALLER THAN R WAVE IN 2 OR MORE LEADS.

When QRS width is normal (<120ms), use this example of NORMAL as your

ECG MARKERS of NORMAL PERFUSION

J POINT ISOELECTRIC

ST SEGMENT: "MILD POSITIVE INCLINATION"

T WAVE: SAME POLARITY AS QRS

When QRS duration is NORMAL (< 120 ms):

NORMAL ST - T WAVES

- WHEN QRS WIDTH IS NORMAL (< 120 ms)

ASSESS:

- J POINT: ISOELECTRIC (or < 1 mm dev.)
- ST SEG: SLIGHT, POSITIVE INCLINATION
- T WAVE: UPRIGHT, POSITIVE

 **in EVERY LEAD EXCEPT aVR !!**

F 60- 0.15-100 Hz 100B CL P?

The Normal 12 Lead EKG

- NSR (rate 60-100, regular rhythm)
- P Waves upright all leads except aVR
- P Waves inverted lead aVR, possibly V1
- QRS upright Leads I, II, III, aVL, aVF, V5, V6
- QRS inverted Leads aVR, V1, V2
- QRS biphasic: Leads V3, V4
- P wave size: up to 2mm tall, 2.5mm long
- QRS height Limb Leads: 5-15mm tall
- QRS height V Leads 10-15mm tall
- QRS width: not to exceed 3mm (120 ms)
- Overall QRS Amplitude: not greater than 30mm

The Normal 12 Lead EKG

- T waves – Upright all Leads except aVR
- T wave – Inverted in Lead aVR
- (everything is inverted in lead aVR)
- T wave MAY be inverted (as a normal variant) in Leads III and aVL.
- Overall QRS Amplitude: not greater than 30mm

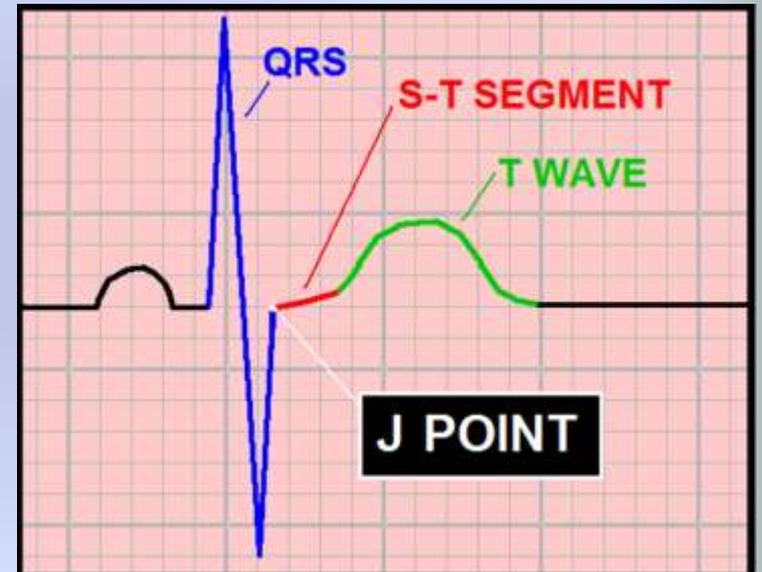

QUESTION:

If we just defined

NORMAL,

what

is

ABNORMAL ? ?

ANSWER:

EVERYTHING ELSE.

If it isn't NORMAL

is

ABNORMAL !!

Simply stated, if the

- J Points
- ST-Segments
- T Waves

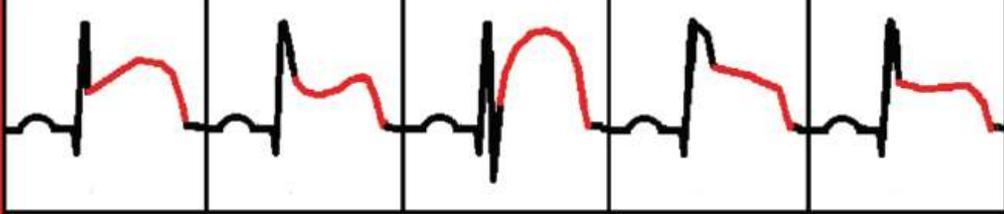

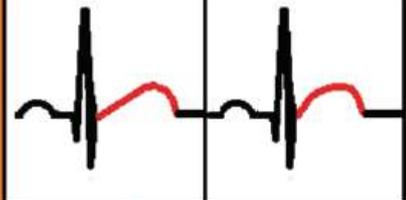

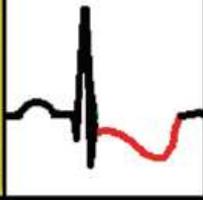

are *NOT NORMAL*,
they are ***ABNORMAL***. . . .

. . . And whenever the

- J Points
- ST-Segments
- T Waves

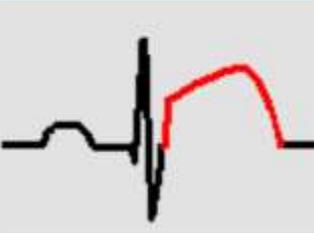

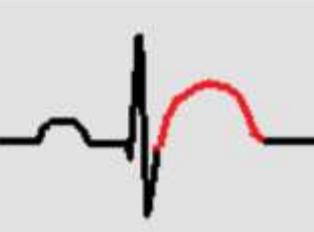

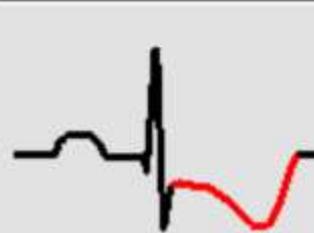

are ***ABNORMAL***, it can be
an ***INDICATION*** of

ACUTE CORONARY SYNDROME !

<p>NORMAL PERFUSION</p>		<ul style="list-style-type: none"> - J POINT ISOELECTRIC - ST SEGMENT: slight POSITIVE inclination - ST-T JUNCTION is CONCAVE - T WAVE smaller than R wave, SMOOTH, ROUNDED (NOT HYPER-ACUTE). T Wave INVERTED in lead AVR, upright in all other leads.
<p>STEMI</p>		<ul style="list-style-type: none"> - J POINT ELEVATED 1mm or more in 2 or more contiguous leads (exception: V2 & V3: men can have up to 2mm, women 1.5mm of normal J Point Elevation) - ST SEGMENT usually CONVEX, may be UPSLOPING, FLAT, or DOWNSLOPING as seen in the examples above.
<p>PATTERNS CONSISTENT WITH</p>		<p>J POINT to APEX of T WAVE:</p> <ul style="list-style-type: none"> - FLAT (example to far left) or - CONVEX (example to immediate left)
<p>EARLY PHASE ACUTE MI</p>		<p>HYPERACUTE T WAVES</p> <ul style="list-style-type: none"> - J POINT ISOELECTRIC or ELEVATED - PEAK of T Wave POINTED, may exceed amplitude of R Wave - Consider Acute MI / Pending MI - Can ALSO indicate: Transmural Ischemia, Hyperkalemia
<p>DYNAMIC CHANGES to a patient's J POINT, ST SEGMENT and/or T WAVE during SERIAL ECGs is a strong indicator of UNSTABLE ISCHEMIA or EARLY INFARCTION</p>		
<p>ACUTE MI or ISCHEMIA</p>		<p>J POINT DEPRESSION, Downsloping ST SEGMENT, inverted T Wave</p> <ul style="list-style-type: none"> - Consider NSTEMI: check cardiac markers - If ST Depression noted in Leads V1 - V4, consider Posterior Wall STEMI: obtain Posterior Lead ECG (see page 7 for details). - If Acute MI not present, rule out MYOCARDIAL ISCHEMIA

13 ECG PATTERNS of ACS & ISCHEMIA

-- J POINT, ST SEGMENT, and T WAVE ABNORMALITIES --

Some less common, less reliable possible indicators of ACS:

? FLAT S-T SEGMENT > 120 ms		- ISCHEMIA
? LOW VOLTAGE T WAVE WITH NORMAL QRS		- ISCHEMIA
? U WAVE POLARITY OPPOSITE THAT OF T WAVE		- ISCHEMIA

Evaluate QTc

- “QUICK PEEK” Method
- QTc – vs – QT Interval

Lead Selection: QT Interval

- Targeted QT measurement using 12 Lead ECG:

Appropriate Lead Selection

The AHA/ACC Foundation/Heart Rhythm Society recommendations for the standardization and interpretation of the ECG (2009) recommend selecting the electrocardiographic lead with the longest T wave when monitoring the QT interval

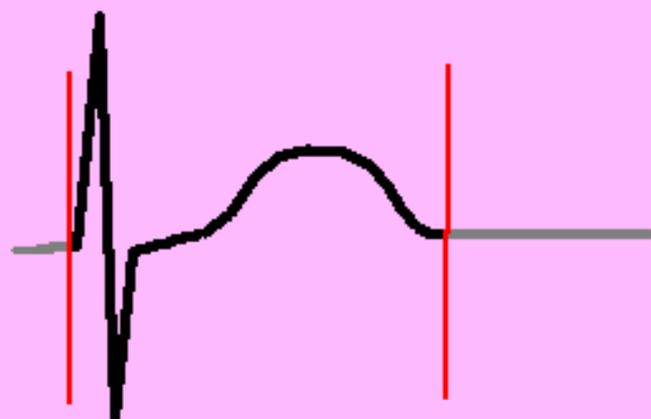

Chest Leads

V2 & V3

often display

LONGEST QT Intervals.

THE Q - T INTERVAL

- BEGINNING OF QRS COMPLEX TO THE END OF THE T WAVE
- NORMAL VALUES VARY BASED ON HEART RATE
- SEVERAL WAYS TO DETERMINE NORMAL LIMITS

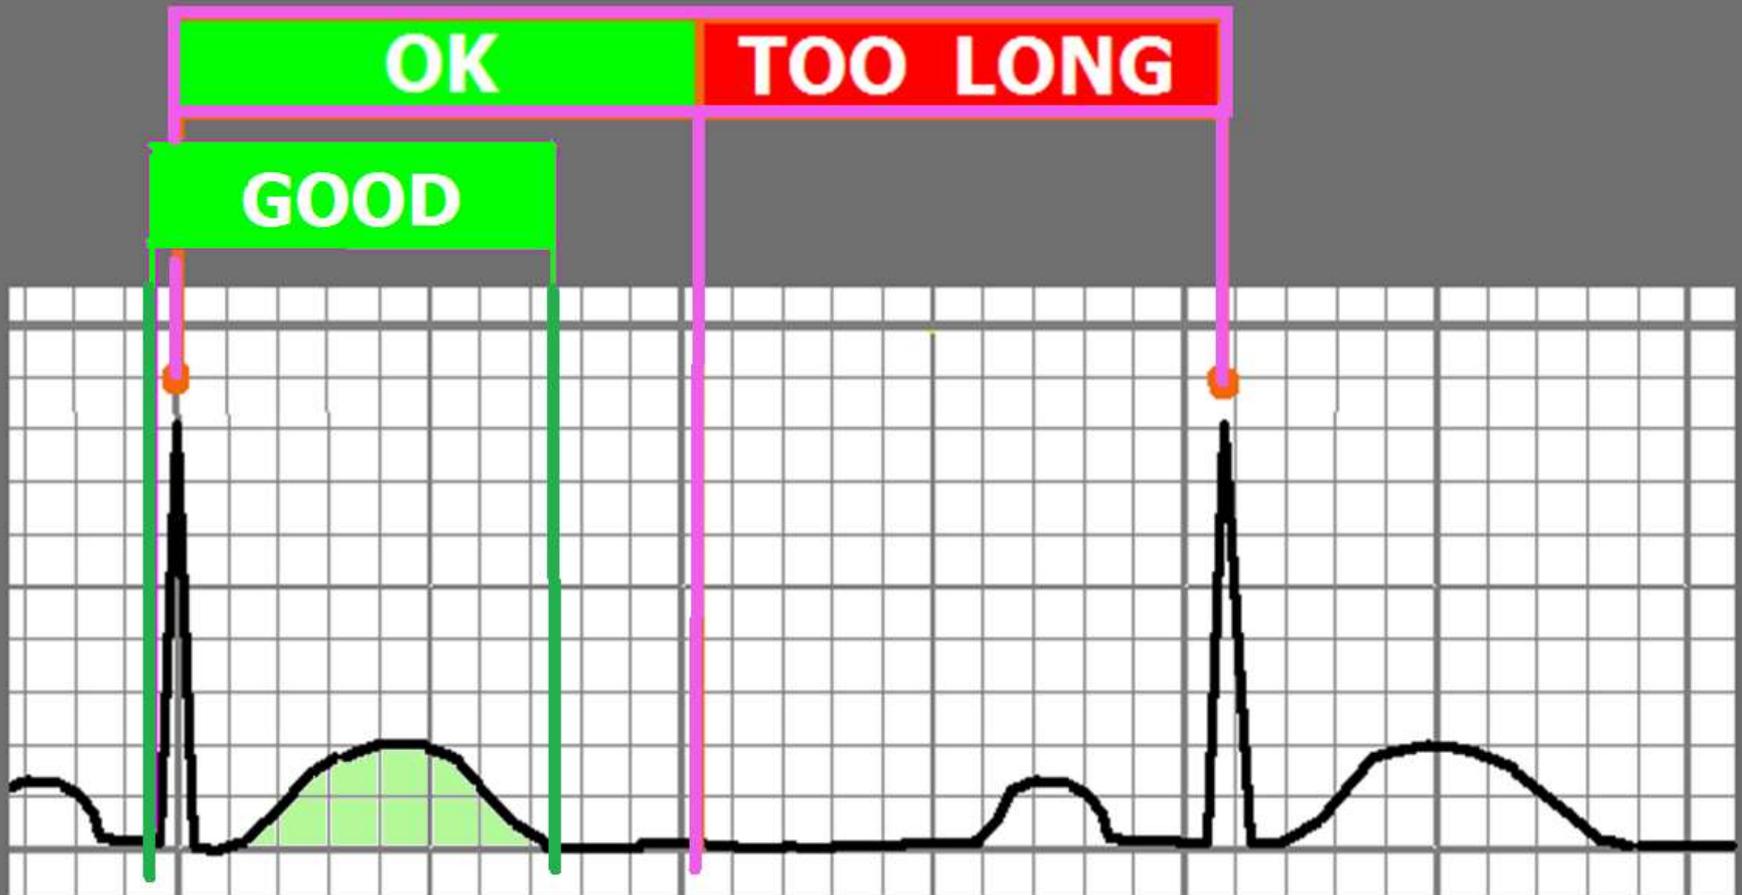

DETERMINING Q-T INTERVAL LIMITS

THE "QUICK PEEK" METHOD

- ☞ Relatively accurate method to quickly identify patients with abnormal QT Intervals.
- Applies to patients with normal heart rates (60-100) and narrow QRS (QRSd < 120ms)

The Q - T Interval
should be LESS THAN $\frac{1}{2}$ the
R - R Interval

The Q - T Interval
should be LESS THAN $\frac{1}{2}$ the
R - R Interval

THE *QTc INTERVAL

* QTc = Q-T interval,
corrected for heart rate

HEART RATE	MALE	FEMALE
150	0.25	0.28
125	0.26	0.29
100	0.31	0.34
93	0.32	0.35
83	0.34	0.37
71	0.37	0.40
60	0.40	0.44
50	0.44	0.48
43	0.47	0.51

Annals of Internal Medicine, 1988 109:905.

Determining the QTc

Manual calculation:

QT CORRECTION FORMULAS:

Bazett's

$$QTc = QT / \sqrt{RR}$$

Fredericia

$$QTc = QT / (RR)^{1/3}$$

Framingham

$$QTc = QT + 0.154(1 - RR)$$

Rautaharju

$$QTp = 656 / (1 + HR/100)$$

Methods to obtain QTc:

- Look at 12 Lead ECG printout (at top of page)

Determining the QT / QTc

Method 1 – 12 Lead ECG Report:

Standard 12 Lead ECG
printout . . .

Heart Rate = 83

QT Interval = 357

QTc = 420

QTc Values:

Too Short: < 390 ms

Normal

-Males: 390 - 450 ms

-Females: 390 - 460 ms

Borderline High

-Males: 450 - 500 ms

-Females: 460 - 500 ms

High (All Genders): 500 - 600 ms

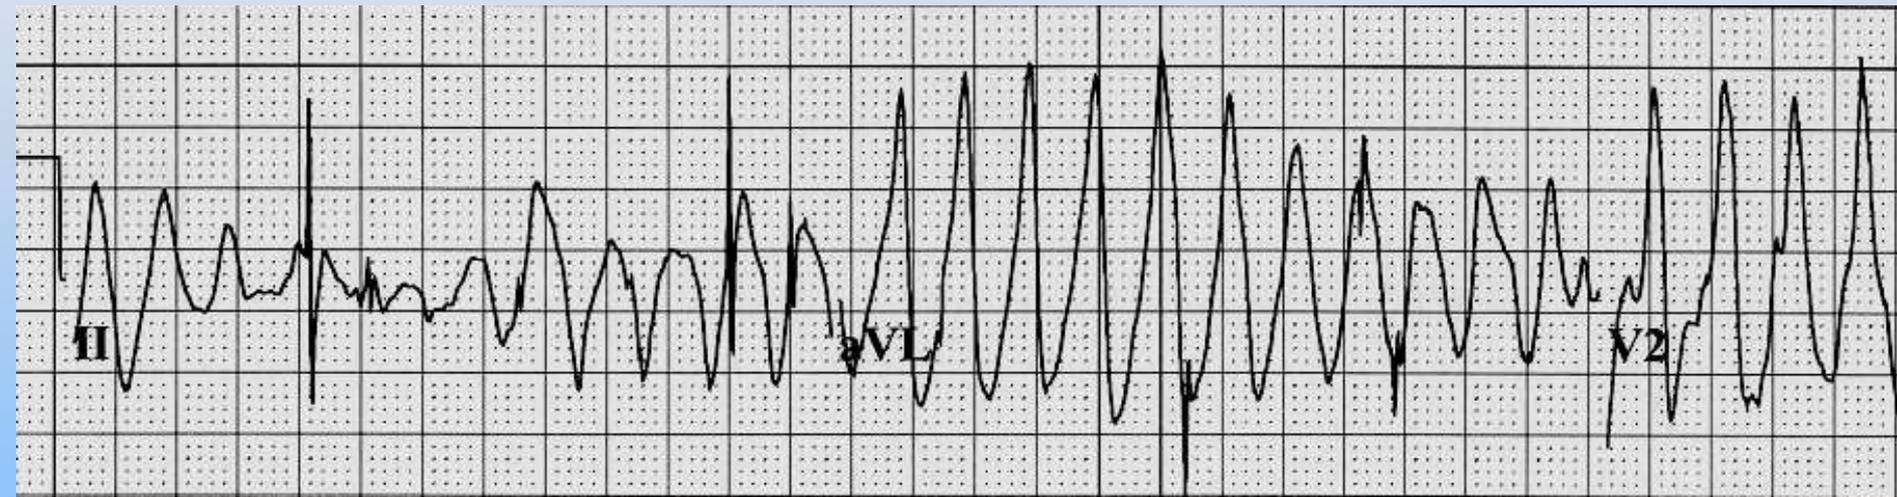

Critical High

(associated with TdP): 600 + ms

Prolonged QT Interval

- **QTc 500 – 520** may be due to oral antiarrhythmics (sotalol, amiodarone, etc)
- **QTc above 500**: NOT ADVISABLE to administer any QT prolonging meds
 - Check electrolytes (especially K, Mg, Ca)
- **QTc 550** and above: advise immediate discontinuance of all QT prolonging meds
- **QTc 600+ ANTICIPATE Torsades de Pointes (TdP)**

Dysrhythmia Associated with Mortality, Triggered by LQTS: *Torsades de Pointes*

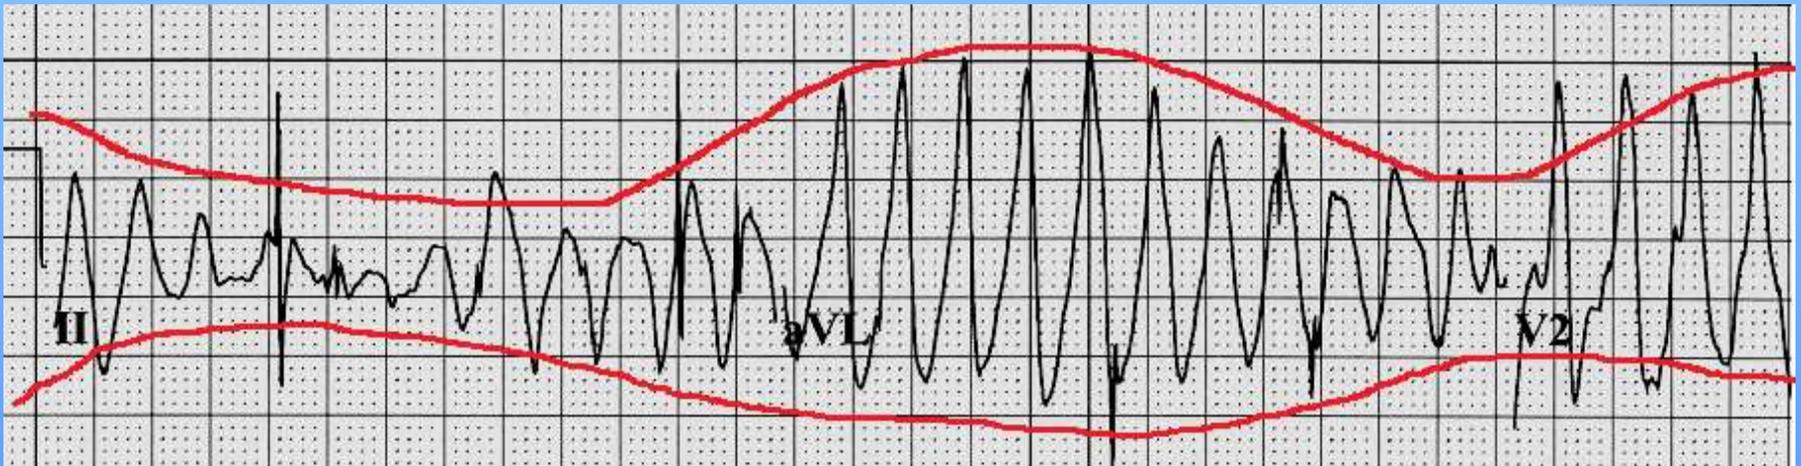

Torsades de Pointes (TdP) – **HEMODYNAMICS:**

- **Decreased – to – NO Cardiac Output**
- **Often patient PULSELESS during episode**
- **Patients often report SYNCOPÉ when TdP self-terminates.**
- **May DETERIORATE into VENTRICULAR FIBRILLATION and CARDIAC ARREST. (“Sudden Death”)**

ECG Characteristics of TdP: The QRS Pattern of *Torsades de Pointes* resembles

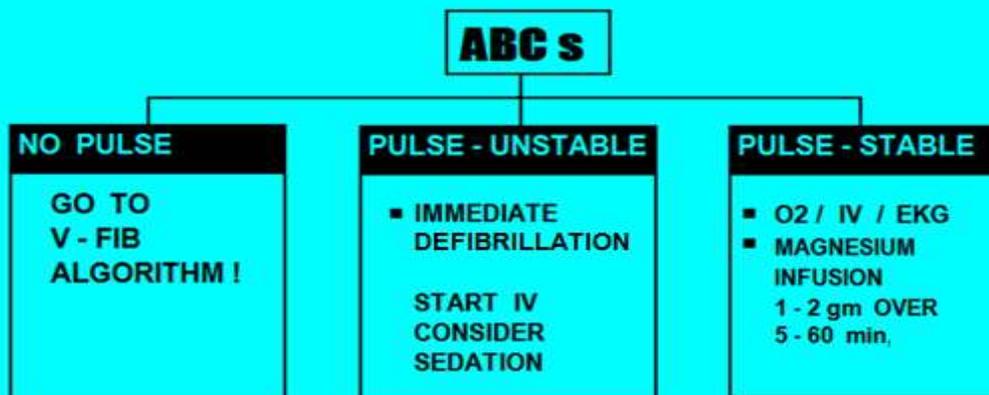

a piece of Twisted Ribbon !

WIDE COMPLEX TACHYCARDIA TORSADES de POINTES

(QRS > 120 ms)

***DO NOT give PROCAINAMIDE, AMIODARONE, or SOTALOL
to patients with TORSADES or POLYMORPHIC VT !!!***

OTHER CONSIDERATIONS:

- EVALUATE BASELINE ECG RHYTHM FOR PRONGED Q-T INTERVAL.
- EVALUATE PATIENT'S MEDS FOR Q-T PROLONGING DRUGS
 - ... if PATIENT HAS BEEN RECEIVING ANY Q-T PROLONGING DRUGS, IMMEDIATELY DISCONTINUE AND CONTACT PHYSICIAN STAT.
- EVALUATE PATIENT HISTORY FOR PREVIOUS EVENTS OF "SYNCOPE OF UNKOWN ETIOLOGY"
- EVALUATE PATIENT FOR FAMILY HISTORY FOR SUDDEN CARDIAC DEATH

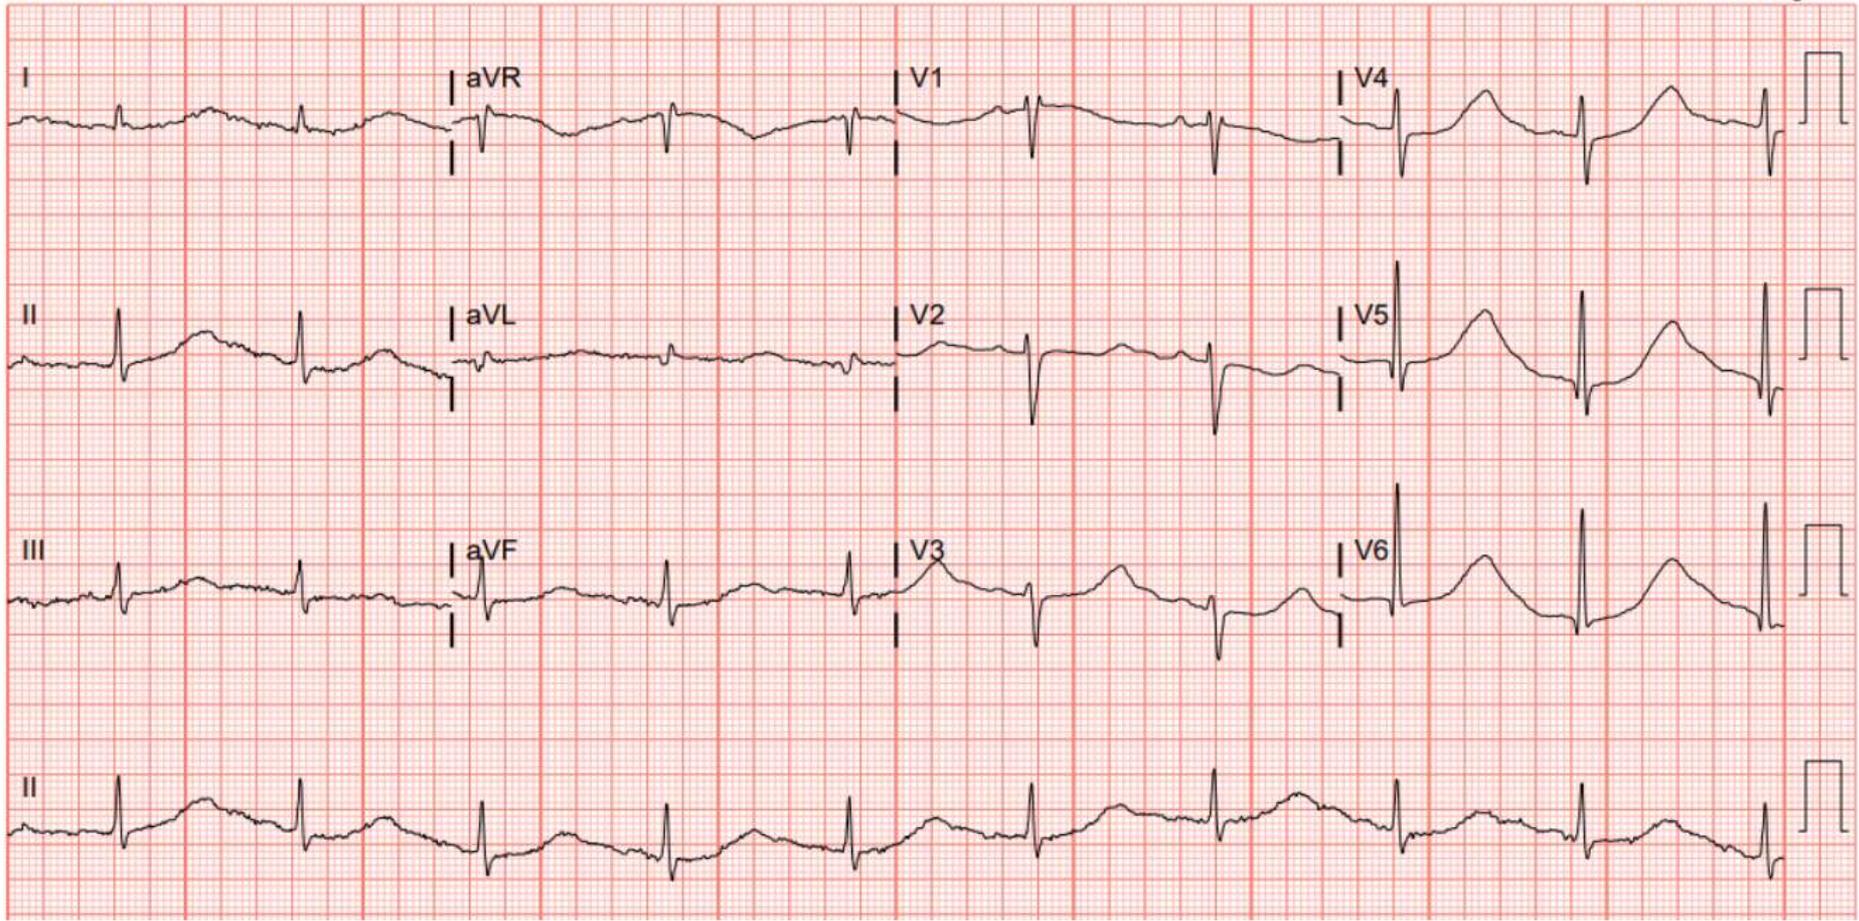

REPORT ANY ABNORMAL FINDINGS TO PHYSICIAN.

WHEN THE "QUICK PEEK" METHOD for QT INTERVAL EVALUATION IS APPLIED TO THE ABOVE ECG, WHAT IS THE RESULT?

Long QT Syndromes and Torsade de Pointes

Gan-Xin Yan

I. Long QT syndrome: What every physician needs to know.

Long QT syndrome (LQTS) is an inherited disorder of delayed ventricular repolarization characterized by a prolonged QT interval on electrocardiography (ECG) and a propensity to torsades de pointes (TdP). TdP by definition is: (1) a polymorphic ventricular tachycardia that occurs specifically under conditions of QT prolongation; and (2) it is almost always initiated by R-on-T ectopic beats.

Clinical manifestations of TdP include syncope (fainting), seizure (epilepsy), or sudden cardiac death. As shown in Figure 1, an episode of sustained TdP was recorded in a patient aged 13 years with LQTS type 2. The episode during which the boy had "seizures" was triggered by the alarm clock in the early morning.

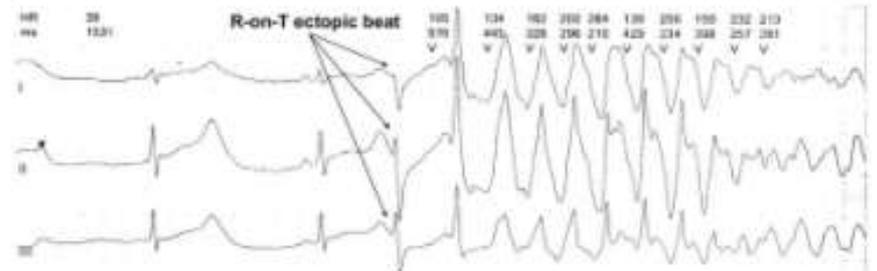

Figure 1:

Torsade de pointes in a long QT syndrome type 2 patient.

(QTc = 672ms !)

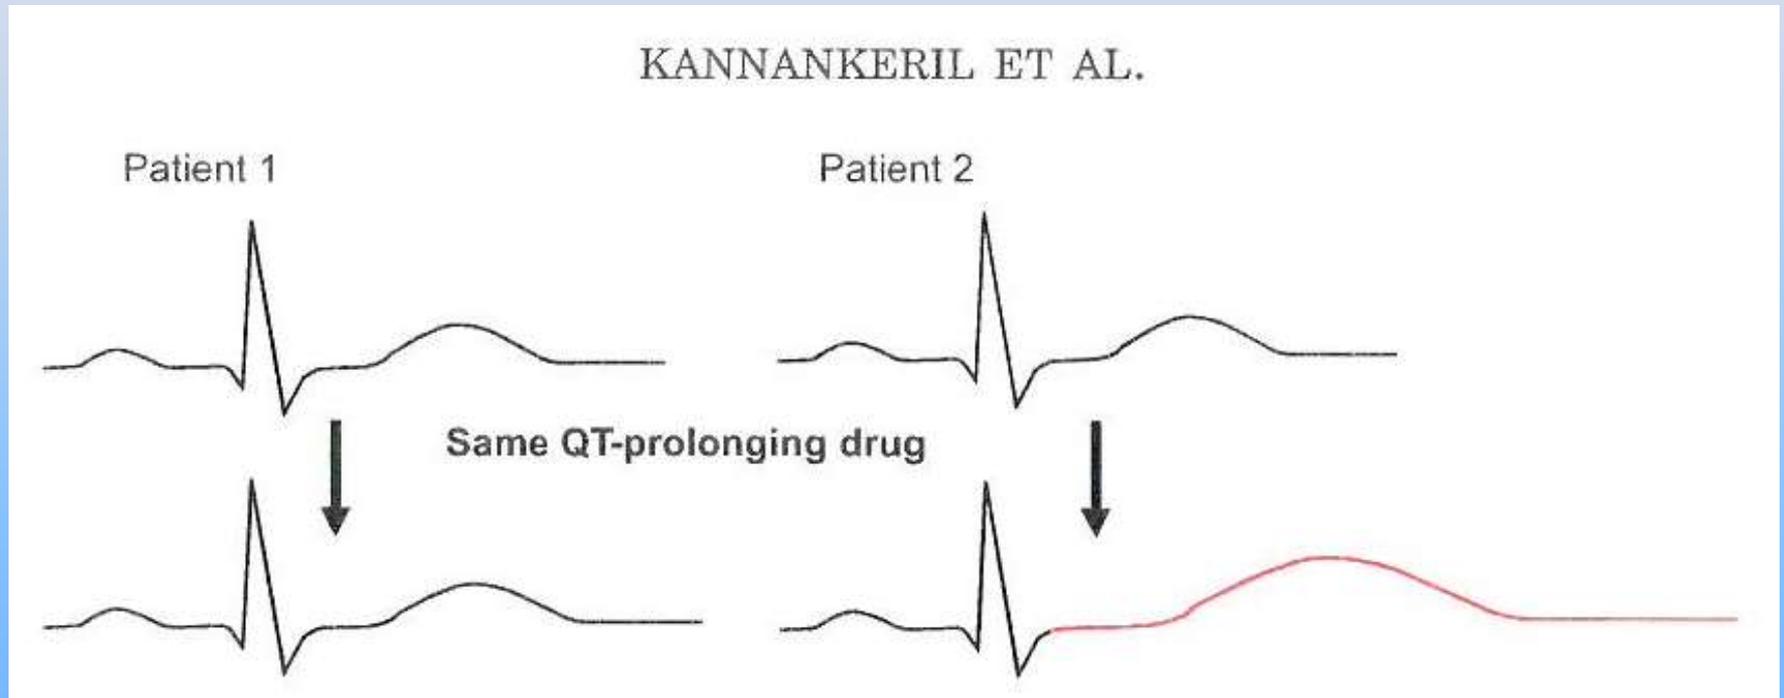

This ECG illustrates the degree of variation that can be noted between different leads on the 12 Lead ECG. ALWAYS measure the QT Interval in the lead with the GREATEST value.

Prolonged QT Interval

- Congenital
- Acquired
 - **MEDICATION INDUCED** – MAJOR CAUSE of IN-HOSPITAL MORTALITY
 - Electrolyte Imbalances (hypomagnesemia, hypokalemia, hypercalcemia)
 - Increased intracranial pressure
 - HYPOTHERMIA (accidental and Induced TTM)

PATIENT 1: NORMAL

PATIENT 2: Genetic susceptibility; sensitivity to QT prolonging drugs:

[Click here for link to paper by Kannankeril et al \(2010 Pharmacological Reviews\) that describes genetic susceptibility described above.](#)

QT Prolongation -- *STAT Intervention:*

 *Avoidance of Meds that are known to prolong the QT Interval. Click here to search medications at CREDIBLEMEDS.ORG*

Commonly used QT prolonging meds include:

-Amiodarone

-Ritalin

-Procainamide

-Pseudoephedrine

-Levaquin

-Haloperidol

-Erythromycin

-Thorazine

-Norpace

-Propulcid

-Tequin

-Zofran

-Benadryl

-Ilbutilide

and MANY more!

Other QT issues

- A-fib: challenging to calculate QTc due to varying R-R intervals. The next slide show the formulas for a more accurate calculation . . .

From: **What Clinicians Should Know About the QT Interval**

JAMA. 2003;289(16):2120-2127. doi:10.1001/jama.289.16.2120

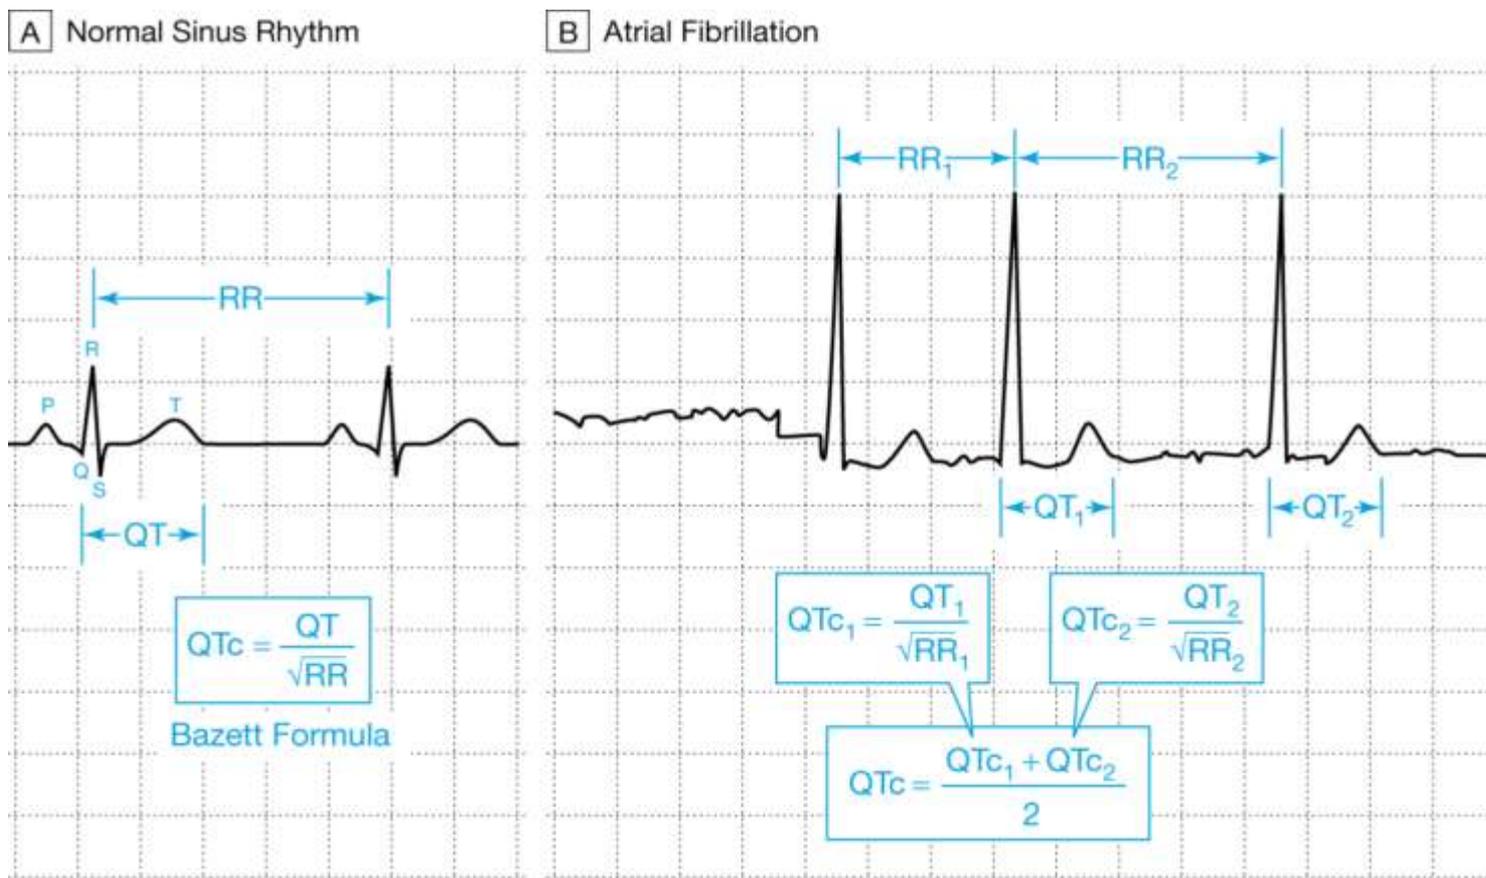

Figure Legend:

QTc indicates corrected QT interval; RR, R-R interval. A, Normal sinus rhythm; the Bazett formula is used to correct the QT interval for the heart rate. B, Atrial fibrillation; QT interval is calculated by taking the average of QT intervals with shortest and longest preceding R-R intervals.

Other QT issues

- A-fib: challenging to calculate QTc due to varying R-R intervals.
- Wide QRS (QRSd >120ms): The delay in depolarization (widening of QRS) will also delay repolarization. Therefore a QT interval that appears “elongated” may be due to nothing more than a Bundle Branch Block.

[Determining QT Interval when Bundle Branch Block is Present: Science Direct \(Elsevier October, 2020\) click here to download article](#)

FIRST DESCRIBED FORMULA

FOR LBBB:

$$QT_m = QT_{LBBB} - 48.5\% * QRS_{LBBB}$$

SIMPLIFIED FORMULA

FOR BBB:

$$QT_m = QT_{BBB} - 50\% * QRS_{BBB}$$

QT_m = estimated QT interval after application of the Formula

QT_{LBBB} = measured QT interval in presence of LBBB

QRS_{LBBB} = measured QRS interval in presence of LBBB

QT_{BBB} = measured QT interval in presence of any BBB

QRS_{BBB} = measured QRS interval in presence of any BBB

The Patient Arrives . . .

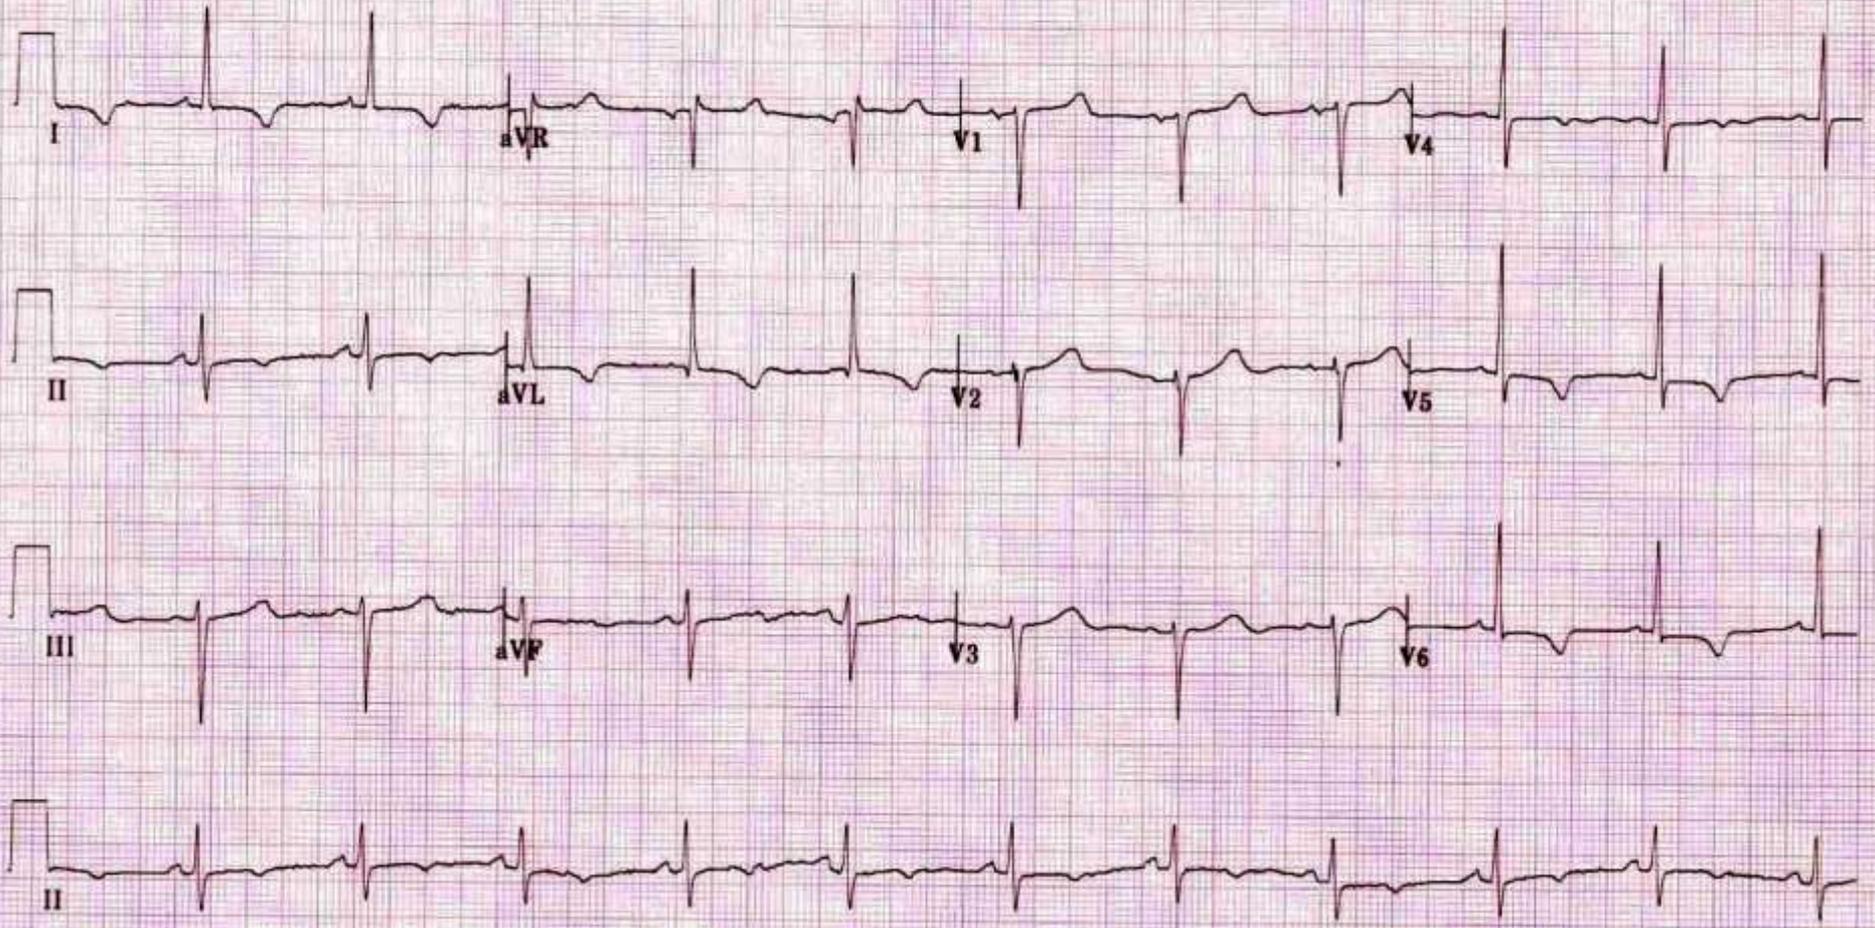

- Standard Tele / ECG hookup:
 - LEAD II
 - LEAD V2
- Evaluate patient: any symptoms of ACS ?
- Review 12 Lead ECG. Look for:
 - Signs of ischemia
 - QT prolongation
- **REPOSITION ECG Leads (if indicated)**

Tele Lead Selection: ABNORMAL 12 Lead ECG (ischemia)

- Review patient's 12 Lead EKG
- Select Lead displaying “worst” signs of ischemia (ST segment, T wave abnormalities) to be the lead used for continuous monitoring
- Set the “automated ST Segment Alarm” for this lead.

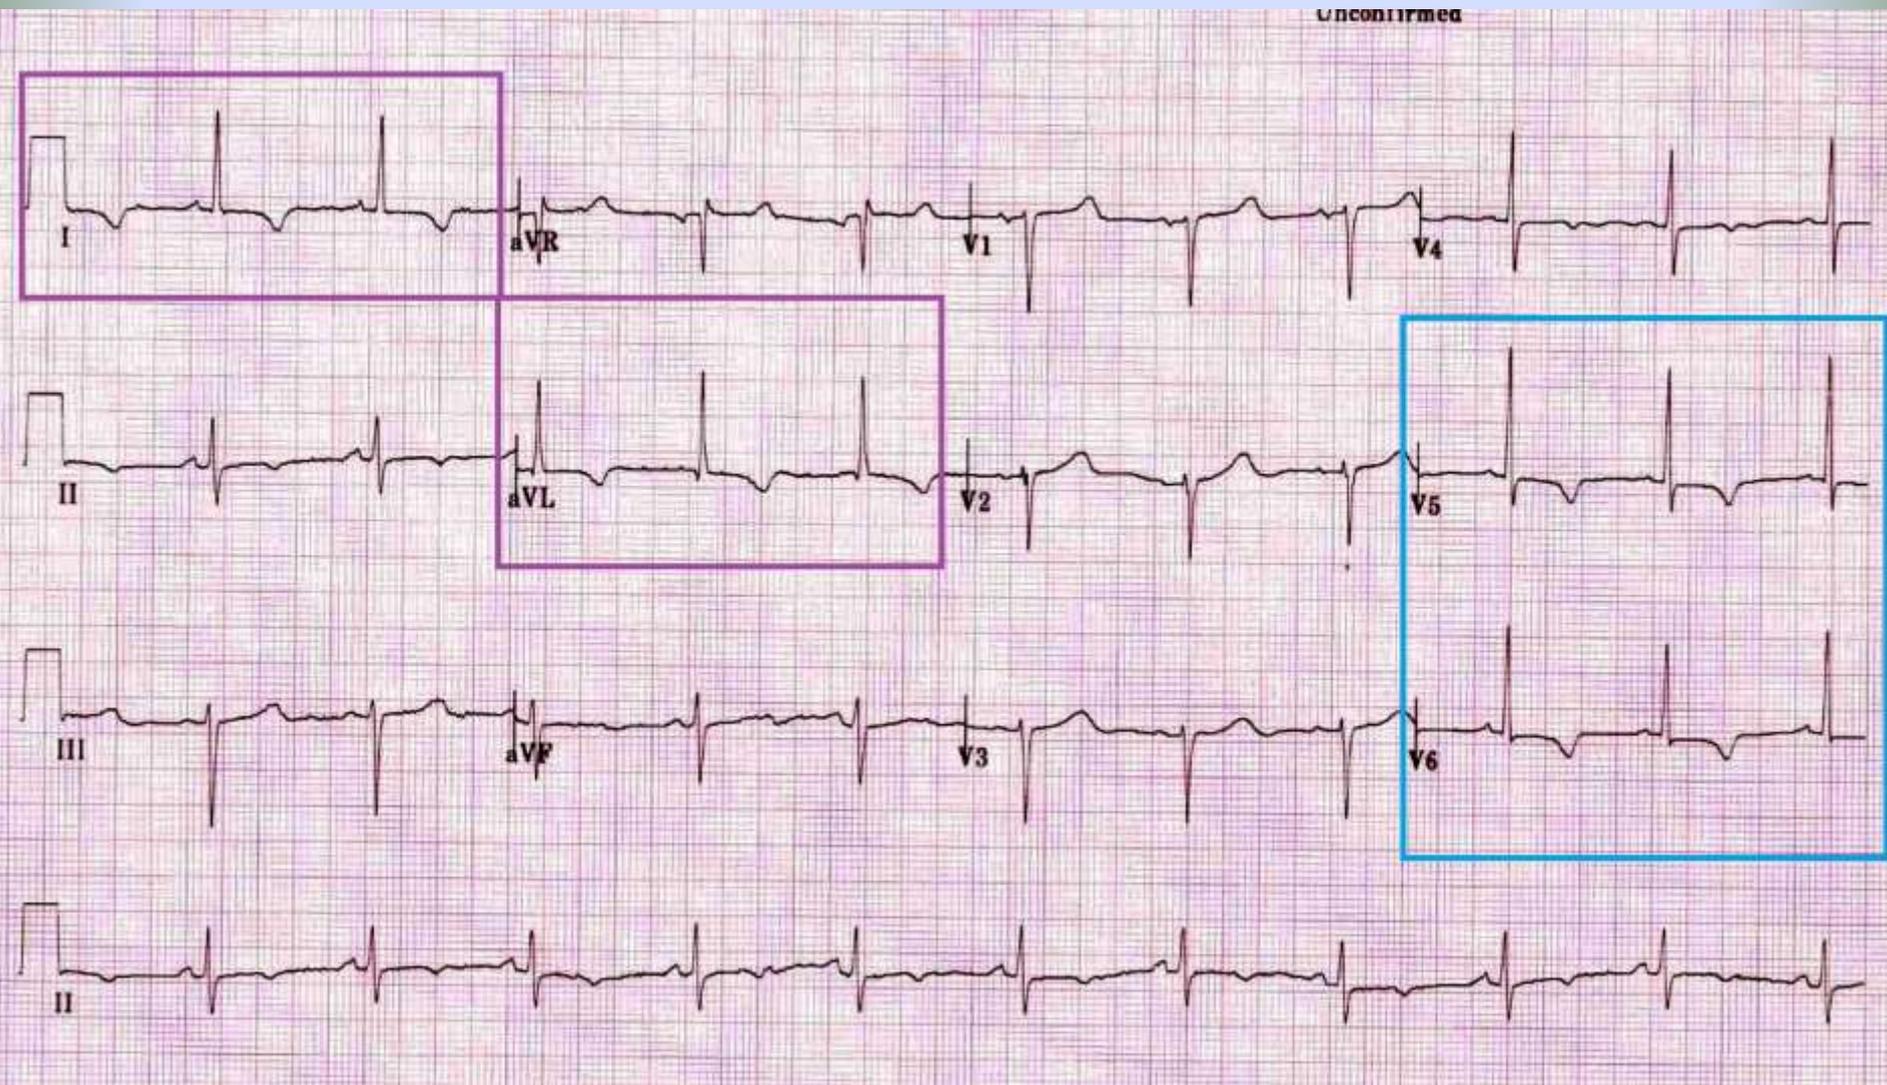

What leads show signs of possible ACS?

Unconfirmed

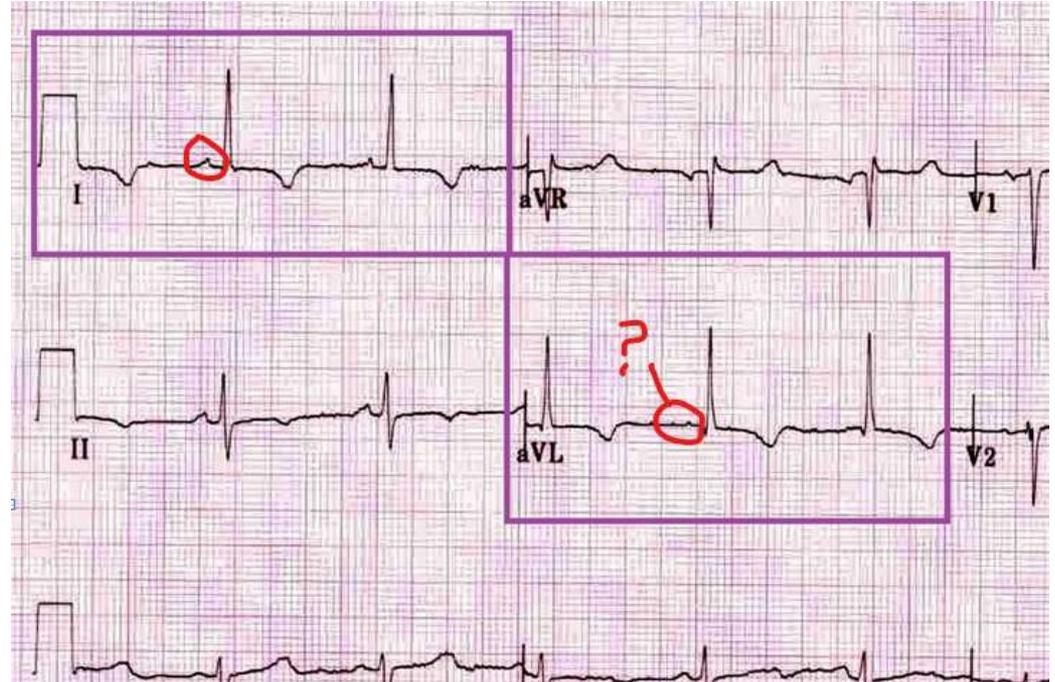

12 Lead ECG

shows **ISCHEMIC CHANGES** Lateral Wall:

Lead Selection: 12 Lead ABNORMAL

- Limb Lead I →

- V2 (if QTc is 500 or more and/or patient receiving QT prolonging medication)
- V5 (if QTc <500ms and patient is NOT receiving QT prolonging meds).

What's the rationale behind monitoring the ECG lead viewing the region of known/suspected ischemia?

The “common sense” rationale:

If your friend says, “pick me up in front of my house in 15 minutes.”

. . . You wouldn't drive around to the back of the house and watch for your friend at the back door.

If you were only monitoring Lead II on this patient with *suspected Anterior Wall ischemia*

.

YOU WOULD MISS THIS:

54years
Male Caucasian

Sample ECG Alerts:

“ECG Alert Values:” When any of the following ECG disturbances are noted, a nurse should immediately assess the patient for hemodynamic compromise and determine need to activate Rapid Response. A STAT 12 Lead ECG should be obtained (unless Code Blue status), and the Physician should be notified.

- a. Acute change in heart rate <40 or greater than >130
- b. New QT Interval prolongation
- c. 2nd or 3rd Degree Heart Block
- d. Sinus Arrest with periods of Asystole (“Pause”)
- e. New Onset Atrial Fibrillation or Atrial Flutter
- f. Premature Ventricular Contractions that are Multifocal, 2 or more coupled together, R on T, or greater than 6 per minute
- g. Ventricular Tachycardia or Wide QRS Tachycardia of unknown origin
- h. Torsades de Pointes***
- i. Ventricular Fibrillation or Asystole
- j. Pacemaker spikes without QRS (Failure to Capture)
- k. Changes in QRS width (new onset Bundle Branch Block)
- l. Changes to the J Point, ST Segment and/or T waves

Alarm Fatigue. It's REAL....

Excerpt from Circulation 2017:

ST-segment alarms (9047) remained high and needed further follow-up interventions.⁴⁷ In 5 ICUs in a single hospital during a period of 31 days, Drew et al⁵⁰ reported that 91% of the 6196 alarms for ST-segment changes were considered nonactionable. Unfortunately, until this unacceptable rate of false and nonactionable alarms can be addressed, we can no longer give a COR I recommendation because false and nonactionable alarm signals distract the nurse, bother the patient, and desensitize clinicians to respond to alarms.^{47,49,50,55} ST-segment monitoring software in its current state

***If the ST-Segment alarm activates,
what should you do ??***

If the ST-Segment alarm activates, what should you do ??

- **Go assess the patient!**
 - Are there any symptoms now present?
 - Changes in prior symptoms?
- **Get a STAT 12 Lead ECG ! . . . And**

If the ST-Segment alarm activates, what should you do ??

- **Go assess the patient!**
 - Are there any symptoms now present?
 - Changes in prior symptoms?
- **Get a STAT 12 Lead ECG ! . . . And**
- ***Compare it to the last ECG(s)!***

PATTERNS of EARLY INFARCTION
-- FLAT and CONVEX J-T APEX SEGMENTS

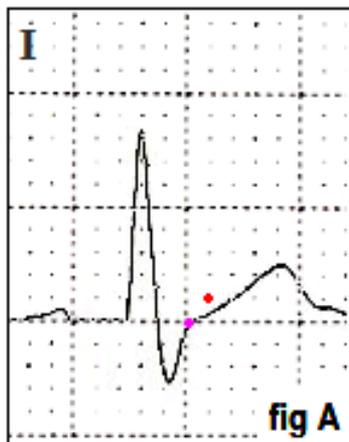

WHEN EVALUATING for ST SEGMENT ELEVATION

From:
AMERICAN HEART ASSOCIATION
ACLS 2005 REVISIONS

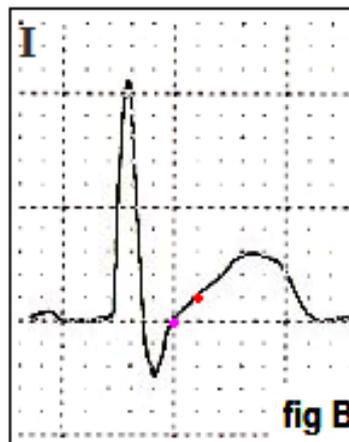

During **NORMAL STATES** of **PERFUSION**, the **J POINT** is **ISOELECTRIC** and the **ST SEGMENT** has a **CONCAVE** appearance. When measured 40 ms beyond the **J POINT** (noted by the **RED DOT**), the **ST SEGMENT** elevation is less than 1mm.

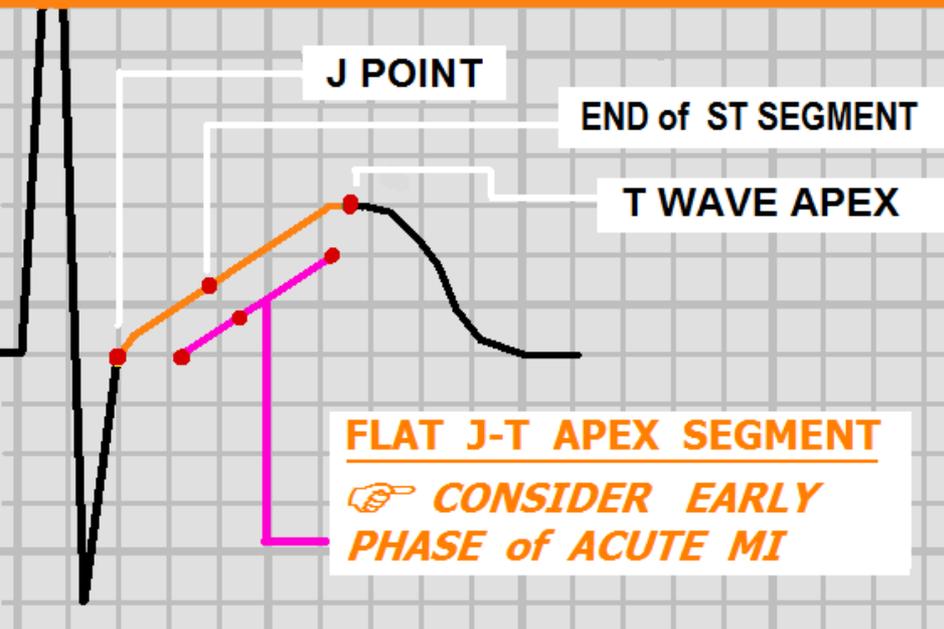

Both figures were recorded from a 54 year old male while resting (figure A), and during PTCA of the Left Anterior Descending artery (figure B).

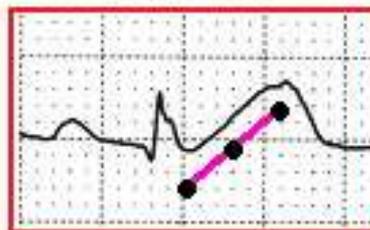

During a 20 second **BALLOON OCCLUSION** of the patient's LAD during routine PTCA, the ST segment assumes a **CONVEX** shape. When measured 40 ms beyond the **J POINT**, the ST segment is elevated > 1 mm. This phenomenon is seen routinely in the cath lab prior to the occurrence of **ST ELEVATION** at the **J POINT** during PTCA and **STENTING**.

CHIEF COMPLAINT and SIGNIFICANT HISTORY:

56 y/o MALE presents to ED with complaint of "INTERMITTENT SUBSTERNAL & SUB-EPIGASTRIC PRESSURE" x 3 HOURS. PMHx of ESOPHAGEAL REFLUX. NO other significant past medical history.

RISK FACTOR PROFILE:

-  FAMILY HISTORY - father died of MI at age 62
- PREVIOUS CIGARETTE SMOKER - quit 15 years ago.
- CHOLESTEROL - DOES NOT KNOW; "never had it checked."
- OBESITY

PHYSICAL EXAM: Patient supine on exam table, mildly anxious, currently complaining of "mild indigestion," skin is warm, pale, dry; REST OF EXAM is UNREMARKABLE.

VITAL SIGNS: BP 142/94, P 80, R 20, SAO2 98%

LABS: JUST OBTAINED, RESULTS NOT AVAILABLE YET.

ECG CRITERIA for DIAGNOSIS of STEMI:

(ST ELEVATION @ J POINT)

*LEADS V2 and V3:

MALES AGE 40 and up ----- 2.0 mm

(MALES LESS THAN 40----- 2.5 mm)

FEMALES ----- 1.5 mm

ALL OTHER LEADS: 1.0 mm or more,
in TWO or more
CONTIGUOUS LEADS

* P. Rautaharju et al, "Standardization and Interpretation of the ECG," JACC 2009;(53)No.11:982-991

STEMI Criteria for 18 Lead ECGs:

Right-Sided Chest Leads

(V3R – V6R): 0.5 mm

Posterior Chest Leads

(V7 – V9): 0.5 mm

* P. Rautaharju et al, "Standardization and Interpretation of the ECG," JACC 2009;(53)No.11:982-991

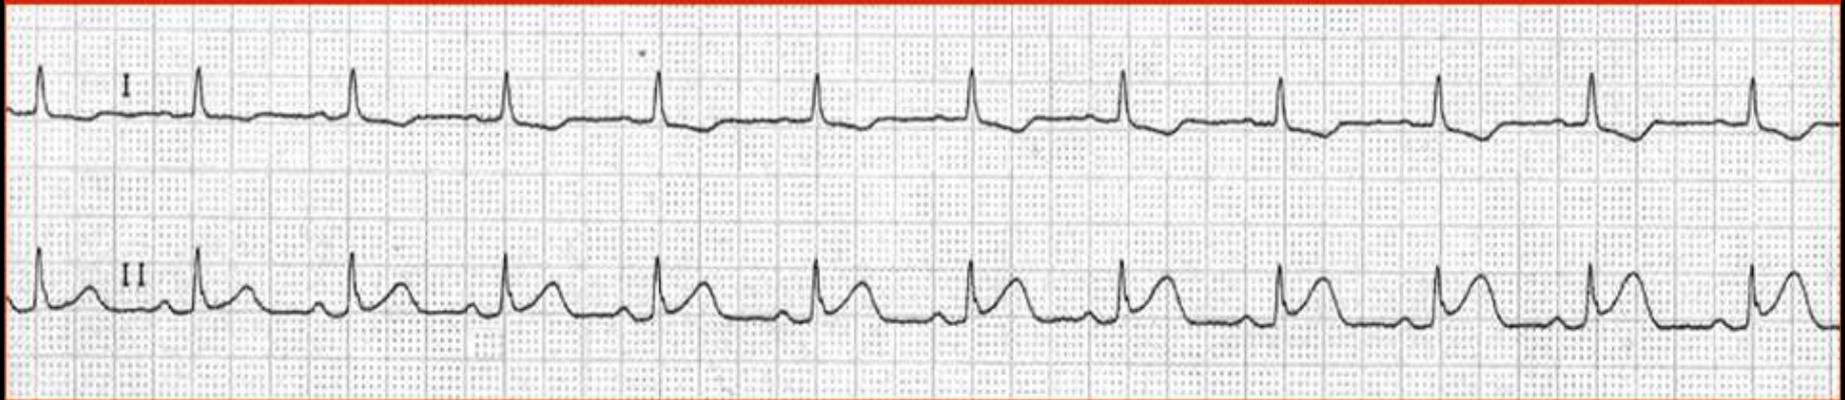

Abnormal ST Elevation Criteria: ACC/AHA 2009 “Standardization and Interpretation of the ECG, Part VI Acute Ischemia and Infarction,” Galen Wagner, et al

Recommendations

1. For men 40 years of age and older, the threshold value for abnormal J-point elevation should be 0.2 mV (2 mm) in leads V_2 and V_3 and 0.1 mV (1 mm) in all other leads.
2. For men less than 40 years of age, the threshold values for abnormal J-point elevation in leads V_2 and V_3 should be 0.25 mV (2.5 mm).
3. For women, the threshold value for abnormal J-point elevation should be 0.15 mV (1.5 mm) in leads V_2 and V_3 and greater than 0.1 mV (1 mm) in all other leads.
4. For men and women, the threshold for abnormal J-point elevation in V_3R and V_4R should be 0.05 mV (0.5 mm), except for males less than 30 years of age, for whom 0.1 mV (1 mm) is more appropriate.
5. For men and women, the threshold value for abnormal J-point elevation in V_7 through V_9 should be 0.05 mV (0.5 mm).
6. For men and women of all ages, the threshold value for abnormal J-point depression should be -0.05 mV (-0.5 mm) in leads V_2 and V_3 and -0.1 mV (-1 mm) in all other leads.

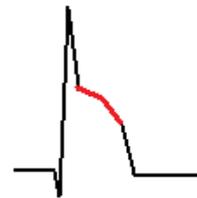

ST SEGMENT ELEVATION:

S-T SEGMENTS ELEVATE WITHIN SECONDS OF CORONARY ARTERY OCCLUSION:

Reciprocal S-T Segment Depression *may* or *may not* be present during STEMI.

Reciprocal S-T Segment Depression *may* or *may not* be present during STEMI.

The presence of S-T Depression on an EKG which exhibits significant S-T elevation is a fairly reliable indicator that STEMI is the diagnosis.

Reciprocal S-T Segment Depression *may* or *may not* be present during STEMI.

The presence of S-T Depression on an EKG which exhibits significant S-T elevation is a fairly reliable indicator that STEMI is the diagnosis.

However the *lack of Reciprocal S-T Depression* DOES NOT rule out STEMI.

ACUTE MI

COMPLICATIONS TO ANTICIPATE FOR ALL MI PATIENTS :

LETHAL DYSRHYTHMIAS

CARDIAC ARREST

**FAILURE OF STRUCTURE(S)
SERVED BY THE BLOCKED ARTERY**

STEMI

- **Correlation of ECG Leads with Coronary Arterial Anatomy and the STRUCTURES SERVED by the OCCLUDED ARTERY**

STEMI

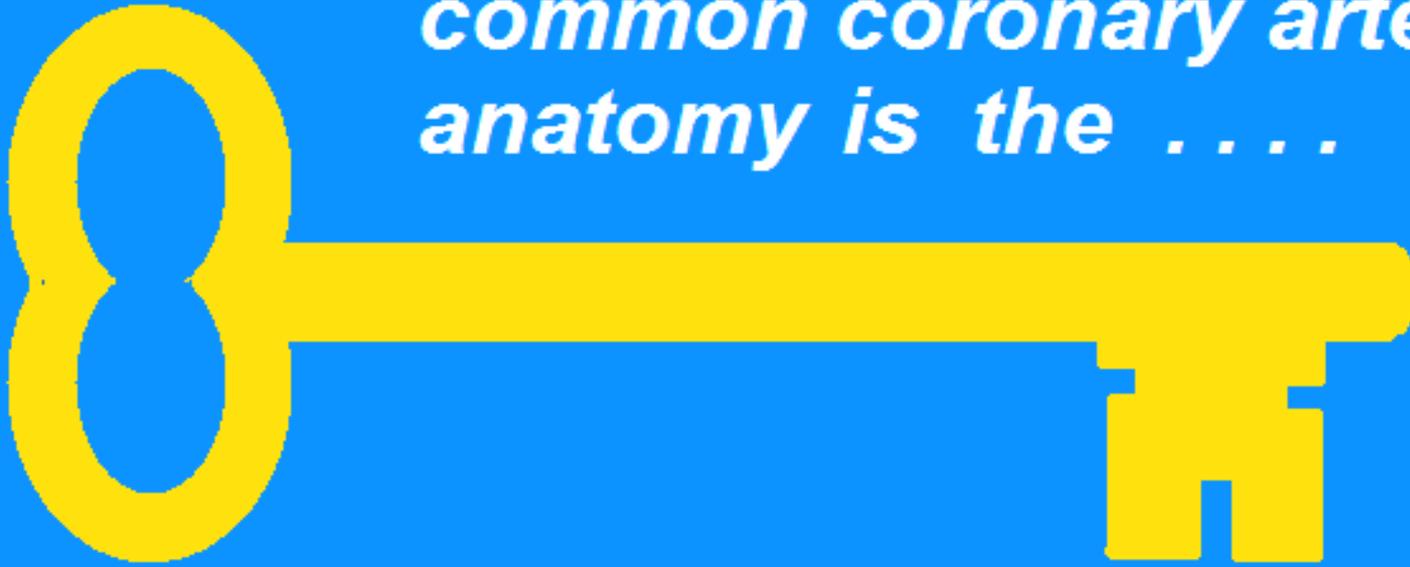

- **Correlation of ECG Leads with Coronary Arterial Anatomy and the STRUCTURES SERVED by the OCCLUDED ARTERY**

. Will serve as a “crystal ball,” allowing you to ANTICIPATE complications of STEMI

STEMI

- **Correlation of ECG Leads with Coronary Arterial Anatomy and the STRUCTURES SERVED by the OCCLUDED ARTERY**
 Will serve as a “crystal ball,” allowing you to **ANTICIPATE** complications of STEMI
 **BEFORE** they occur !!

*"Having knowledge of
common coronary artery
anatomy is the*

*to understanding the **PHYSIOLOGICAL
CHANGES** that occur during **ACUTE MI.**"*

***"an INVALUABLE ASSET for ALL MEDICAL
PROFESSIONALS who
provide direct care to STEMI patients !"***

INTERPRET THE EKG, THEN:

- KEY IDENTIFY THE AREA OF THE HEART WITH A PROBLEM ...
- KEY RECALL THE ARTERY WHICH SERVES THAT REGION ...
- KEY RECALL OTHER STRUCTURES SERVED BY THAT ARTERY ...
- KEY ANTICIPATE FAILURE OF THOSE STRUCTURES ...
- KEY INTERVENE APPROPRIATELY!

Do not remove this from the outer bag until ready to use.
Do not use if overwrap has been damaged or if contents are damaged.
The inner bag maintains the sterility of the solution.

400 mg Dopamine

(1600 mcg/mL)
Dopamine Hydrochloride
and 5% Dextrose Injection USP

250 mL

Each 100 mL contains 160 mg Dopamine Hydrochloride USP & 5 g Dextrose Hydrochloride USP, pH adjusted with hydrochloric acid, buffered as a stabilizer. Osmolality 269 mOsmol/L, pH 3.5 (2.5 to 4.5). Sterile, nonpyrogenic, single dose container. Dopamine should not be made to this solution. Dosage instructions should be directed by a physician. See directions. Caution: Breakage of the inner bag may result in leakage of the solution. If any leakage is found, discard. Airtight inner bag used in series connections. Do not mix in series connections with blood admixtures or solutions with blood. Do not use if this solution is clear and is not darker than slightly yellow. Rx Only. Recommended storage: Room temperature (25°C). Avoid excessive heat. Protect from freezing.

To see the
RIGHT VENTRICLE . . .

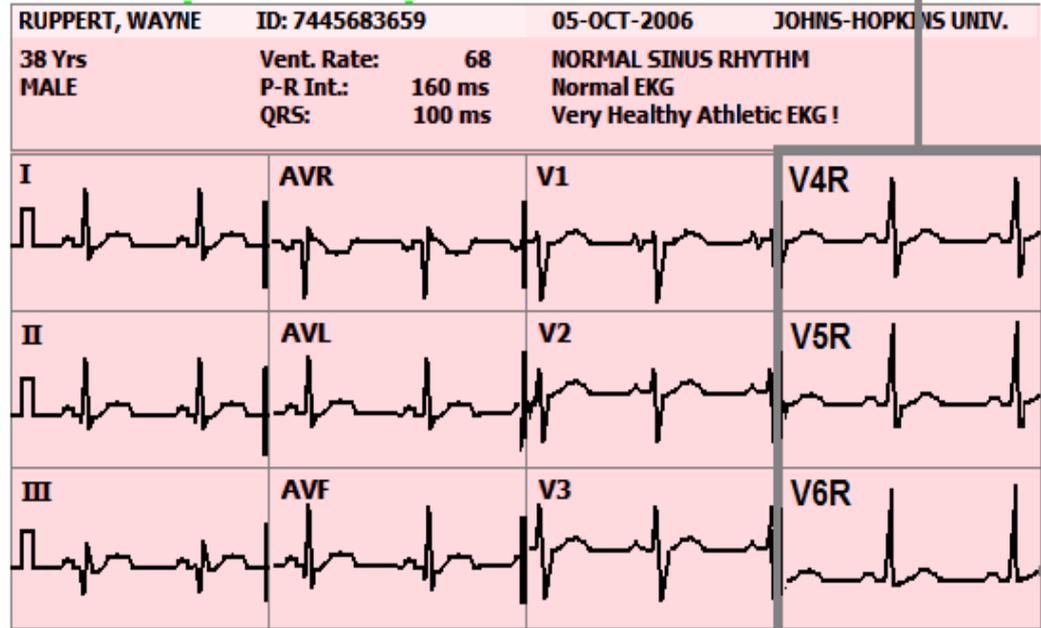

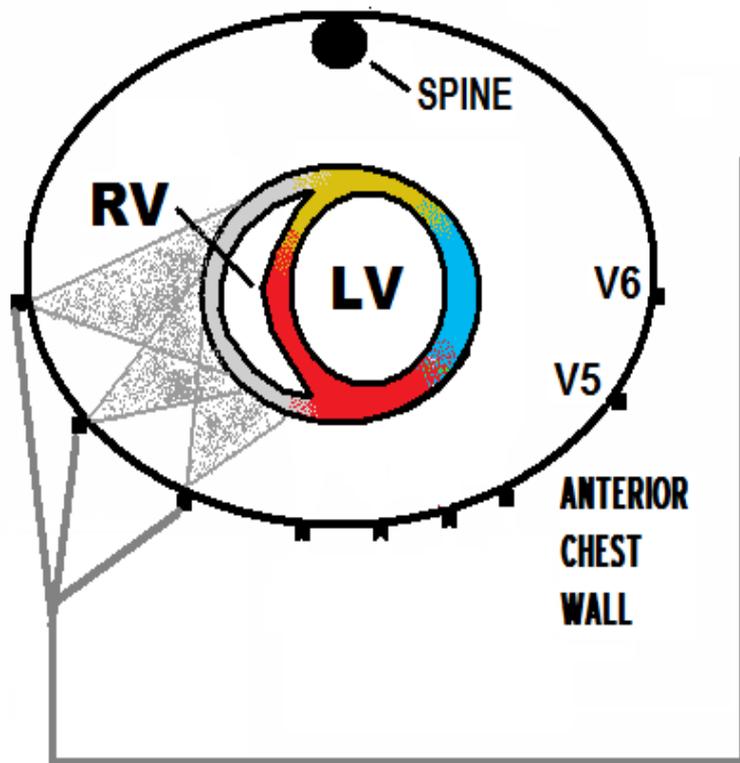

. . . such as in cases of
INFERIOR WALL M.I.

You must do a

RIGHT - SIDED EKG !!

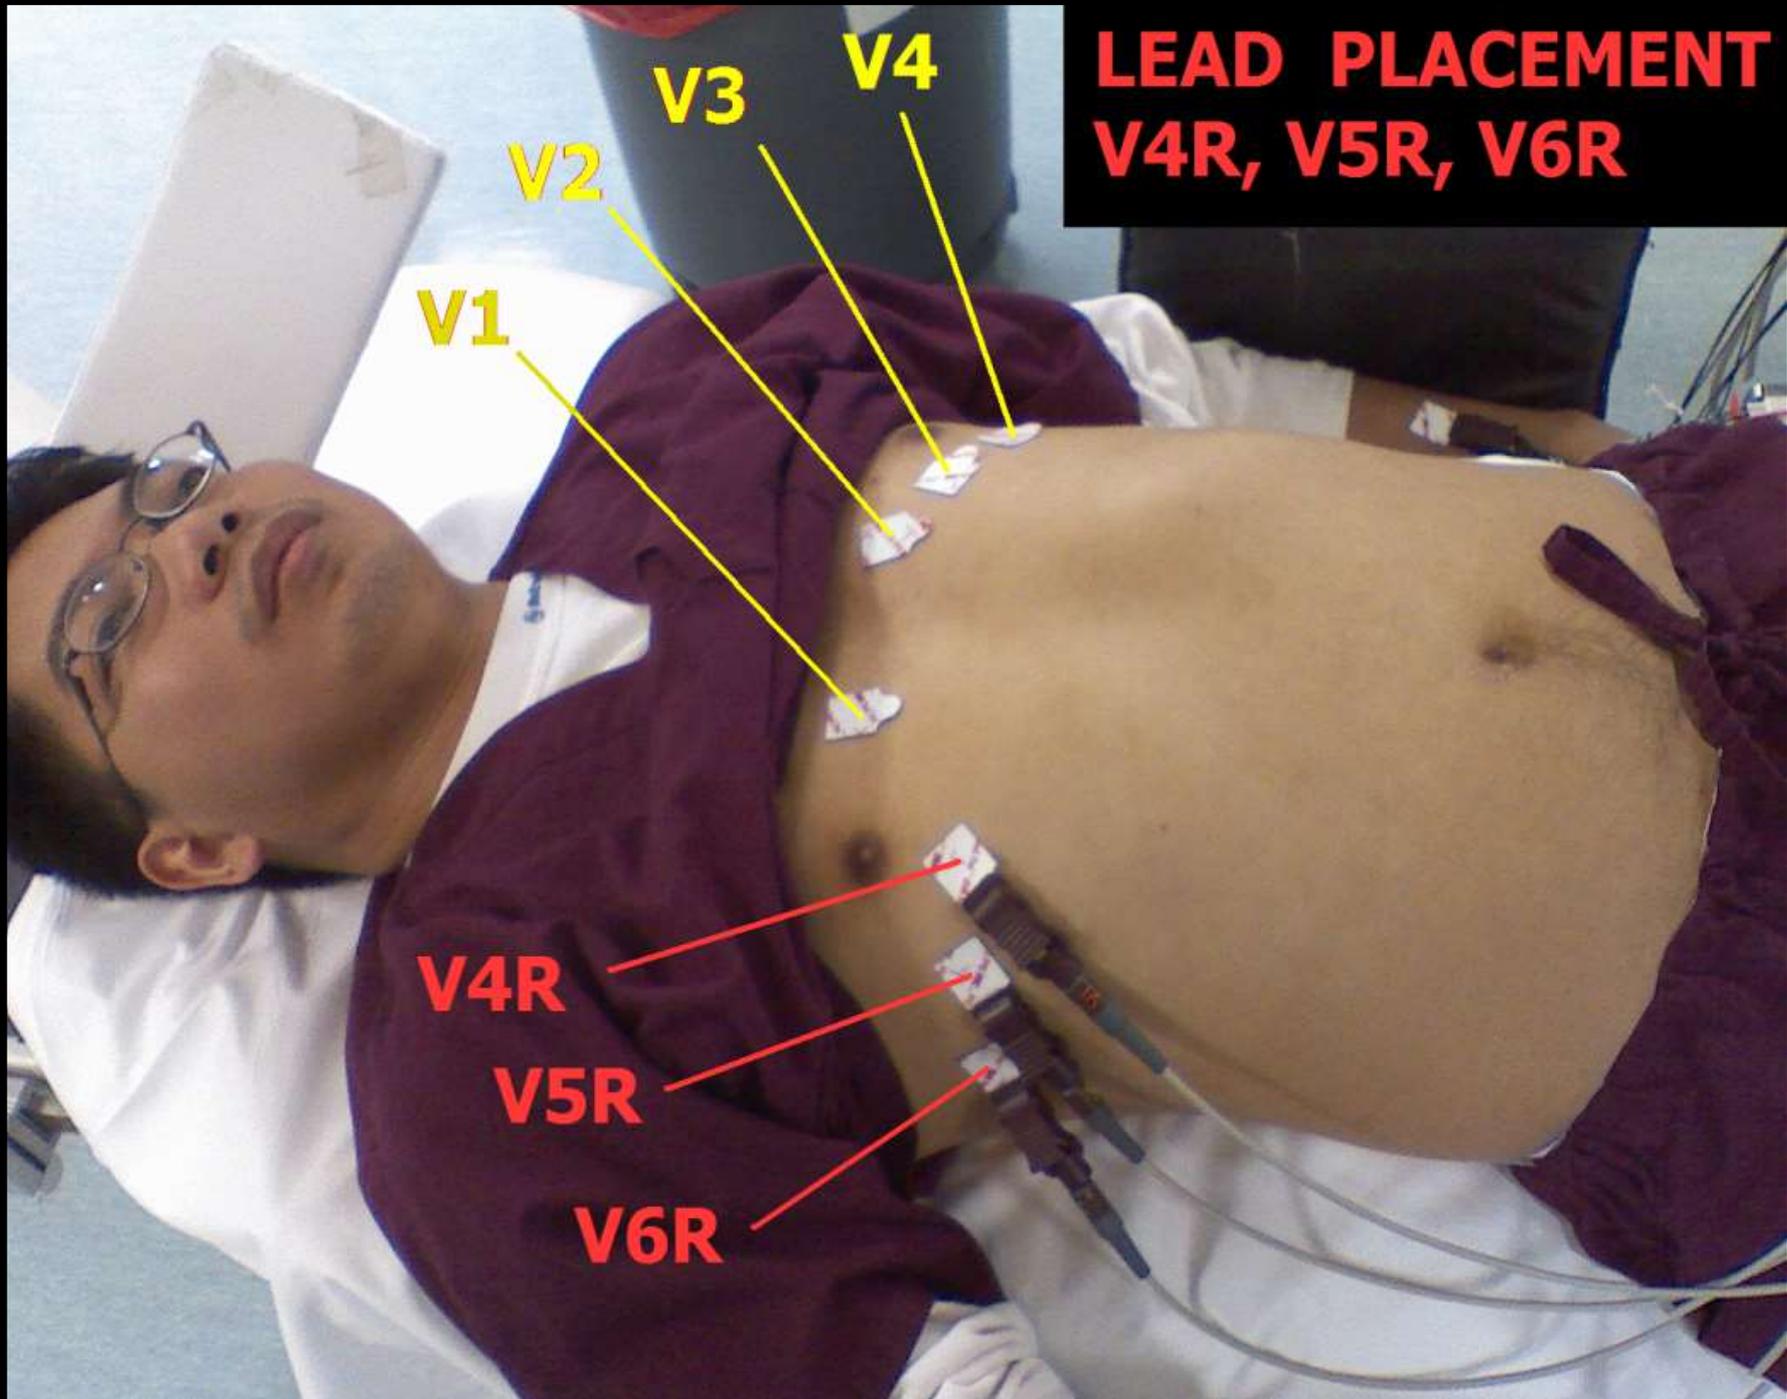

V4R - V6R VIEW THE RIGHT VENTRICLE

Right Ventricular Infarct

V LEADS
 R SIDE

Referred by:

Unconfirmed

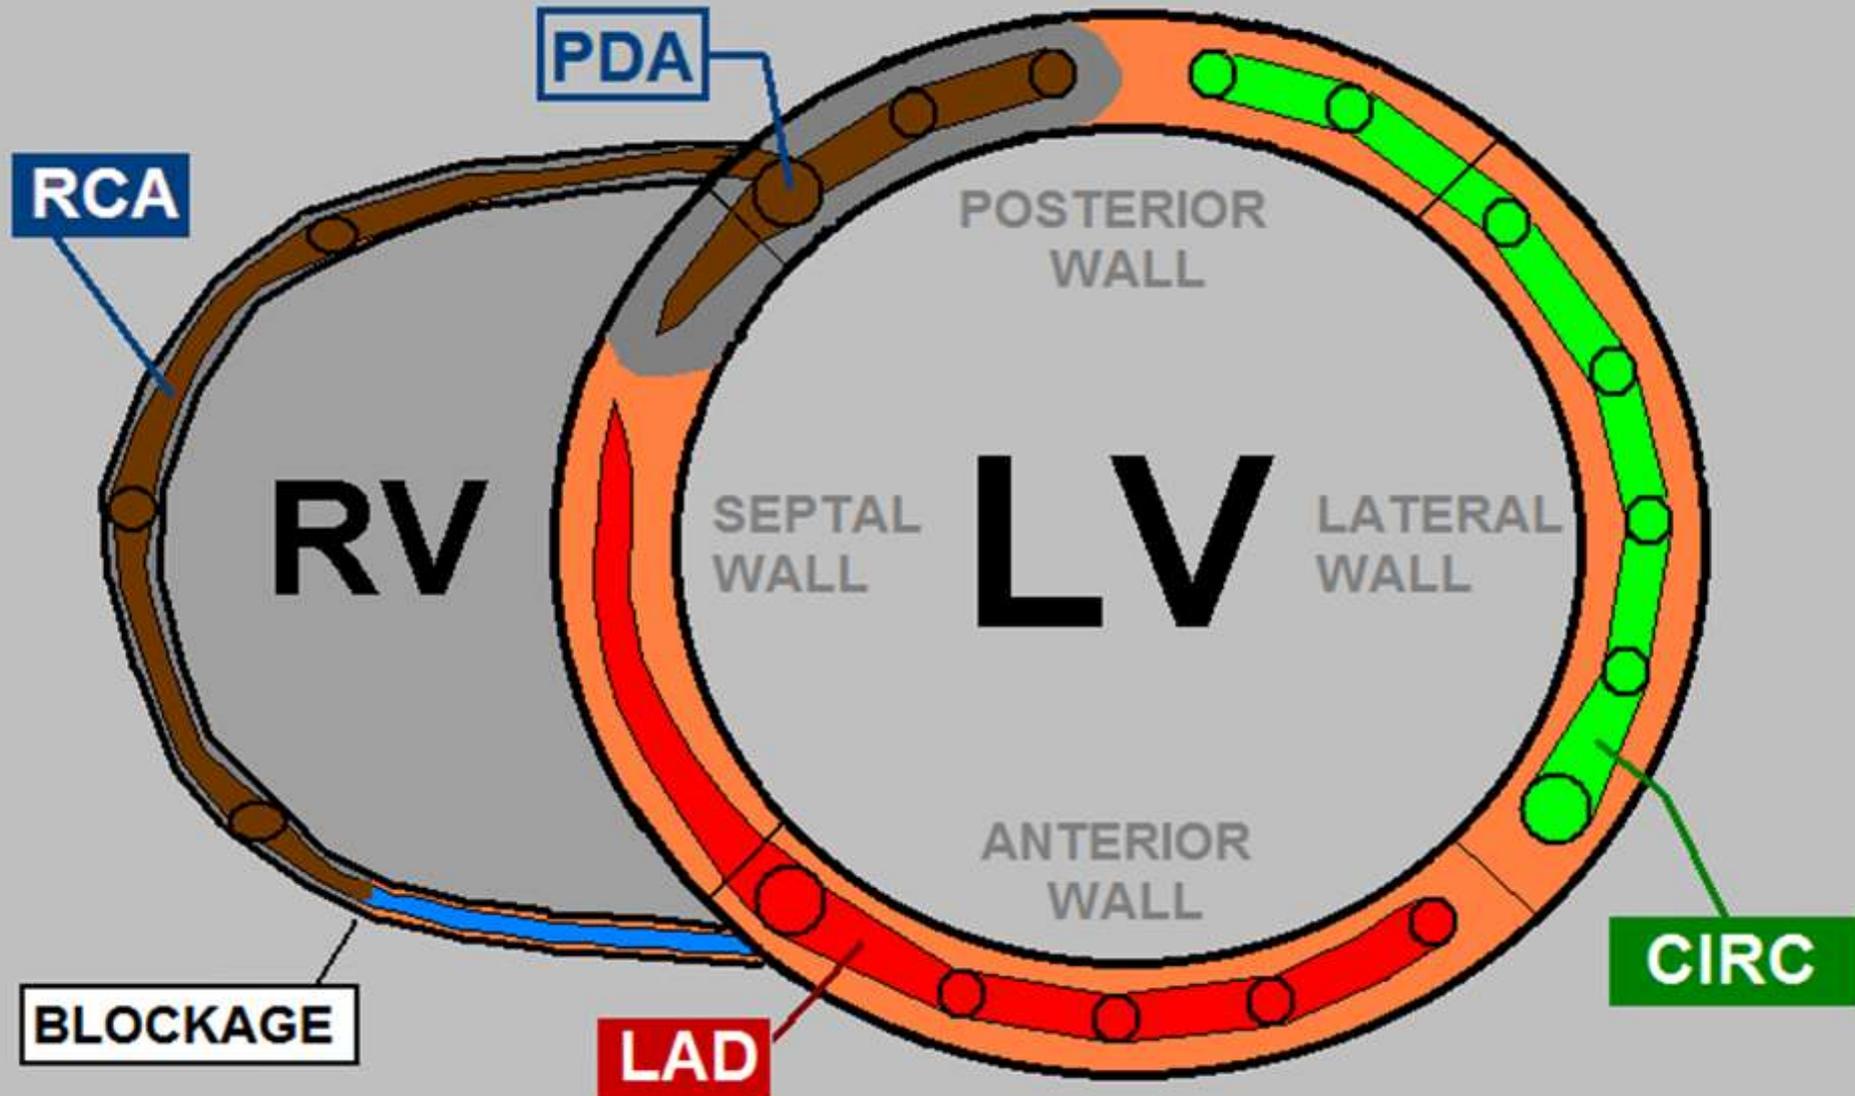

INDICATOR	COMPLICATION
1. S-T DEPRESSION IN THE V-LEADS (PREDOMINANTLY V1 - V3)	→ POSTERIOR WALL MI
2. S-T ELEVATION IN LEADS V5, V6, LEAD I, and AVL	→ LATERAL WALL MI
3. S-T ELEVATION in LEADS V3r - V6r (RIGHT-SIDED EKG)	→ R. VENTRICULAR MI

INFERIOR - RIGHT VENTRICULAR MI

DOMINANT RCA

75-80 % of POPULATION

ANTICIPATED COMPLICATIONS of INFERIOR WALL STEMI secondary to RCA Occlusion & POSSIBLE INDICATED INTERVENTIONS:

- CARDIAC ARREST	BCLS / ACLS
- CARDIAC DYSRHYTHMIAS (VT / VF)	ACLS (antiarrhythmics)
- SINUS BRADYCARDIA	ATROPINE 0.5mg, REPEAT as needed UP TO 3mg. (follow ACLS and/or UNIT protocols)
- HEART BLOCKS (1st, 2nd & 3rd Degree HB)	ATROPINE 0.5mg, REPEAT as needed UP TO 3mg, Transcutaneous Pacing, (follow ACLS and/or UNIT protocols)
- RIGHT VENTRICULAR MYOCARDIAL INFARCTION	<ul style="list-style-type: none"> - The standard 12 Lead ECG does NOT view the Right Ventricle. - You must do a RIGHT-SIDED ECG to see if RV MI is present. - Do NOT give any Inferior Wall STEMI patient NITRATES or DIURETICS until RV MI has been RULED OUT.
- POSTERIOR WALL INFARCTION	<ul style="list-style-type: none"> - POSTERIOR WALL MI presents on the 12 Lead ECG as ST DEPRESSION in Leads V1 - V3. - POSTERIOR WALL MI is NOT PRESENT ON THIS ECG.

POST PTCA / STENT DEPLOYMENT TO PROXIMAL RCA

IN *EVERY* CASE of

INFERIOR WALL STEMI

You must first *RULE OUT*

RIGHT VENTRICULAR MI

BEFORE giving any:

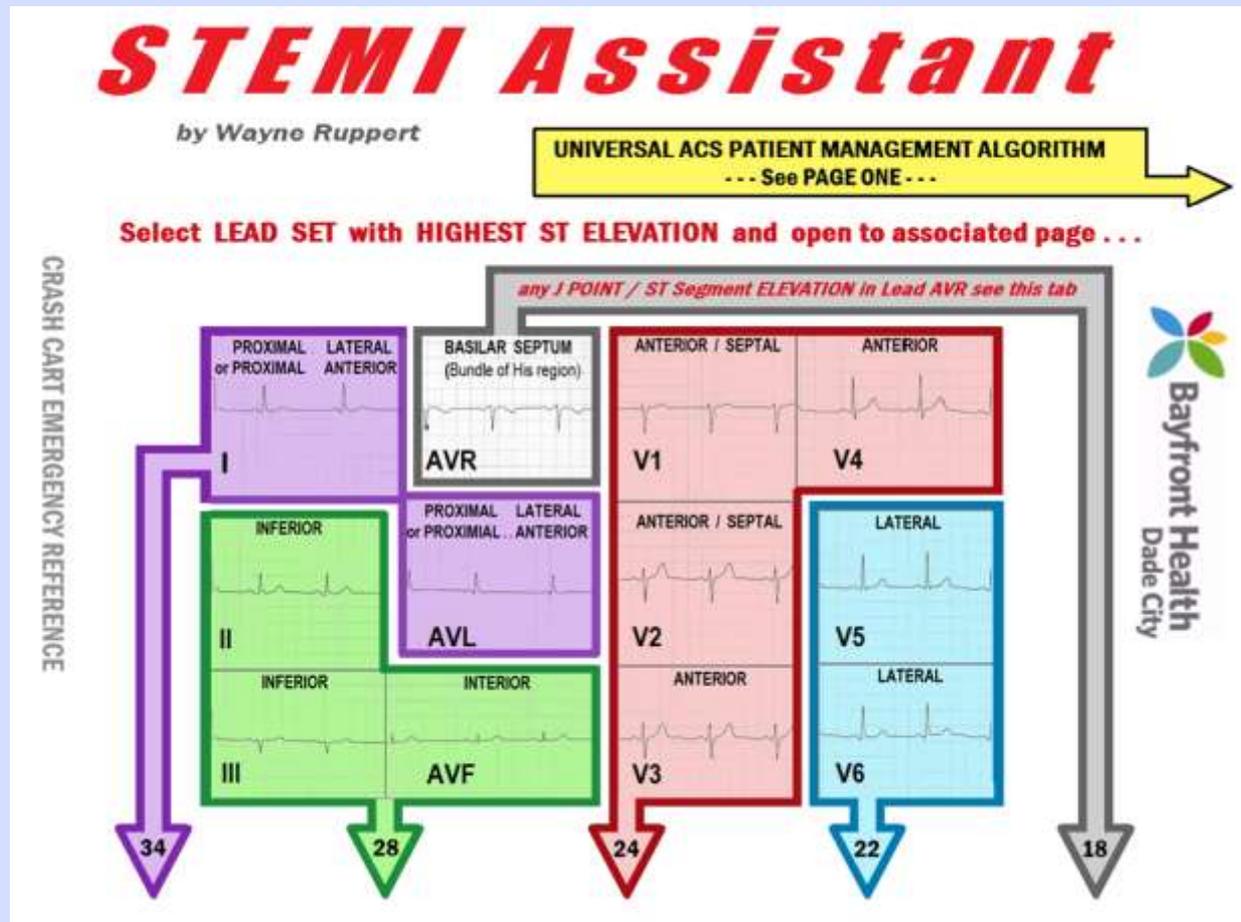

- NITROGLYCERIN
- Diuretics

**Nitroglycerin & Diuretics
are
CLASS III CONTRINDICATED
in
RIGHT VENTRICULAR MI ! !***

**They precipitate SEVERE
HYPOTENSION**

ST Depression Leads V1 - V4

**Minimal ST Elevation in Lead V6.
(Does not meet STEMI Criteria)**

- Abnormal ECG -

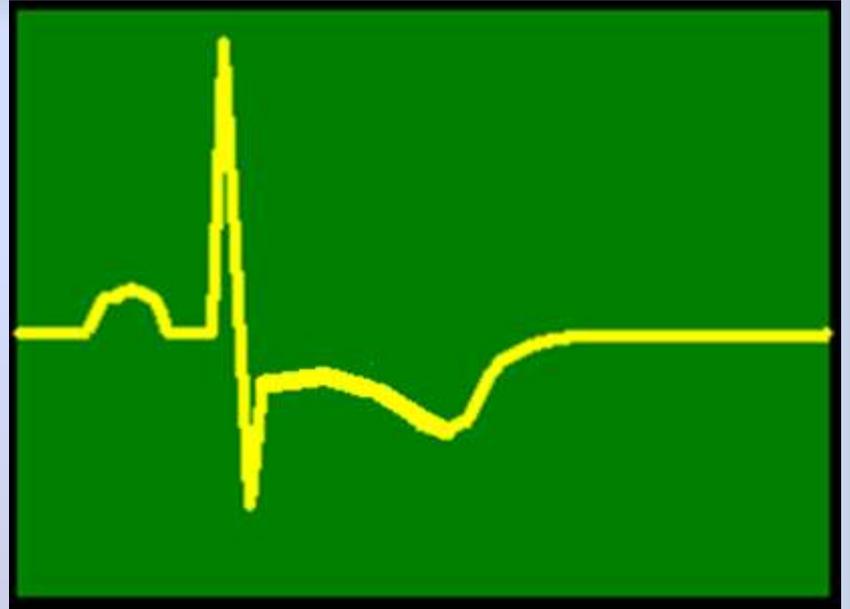

ST Depression in Leads V1 – V4:

- **Direct view of ISCHEMIA (anterior wall)**

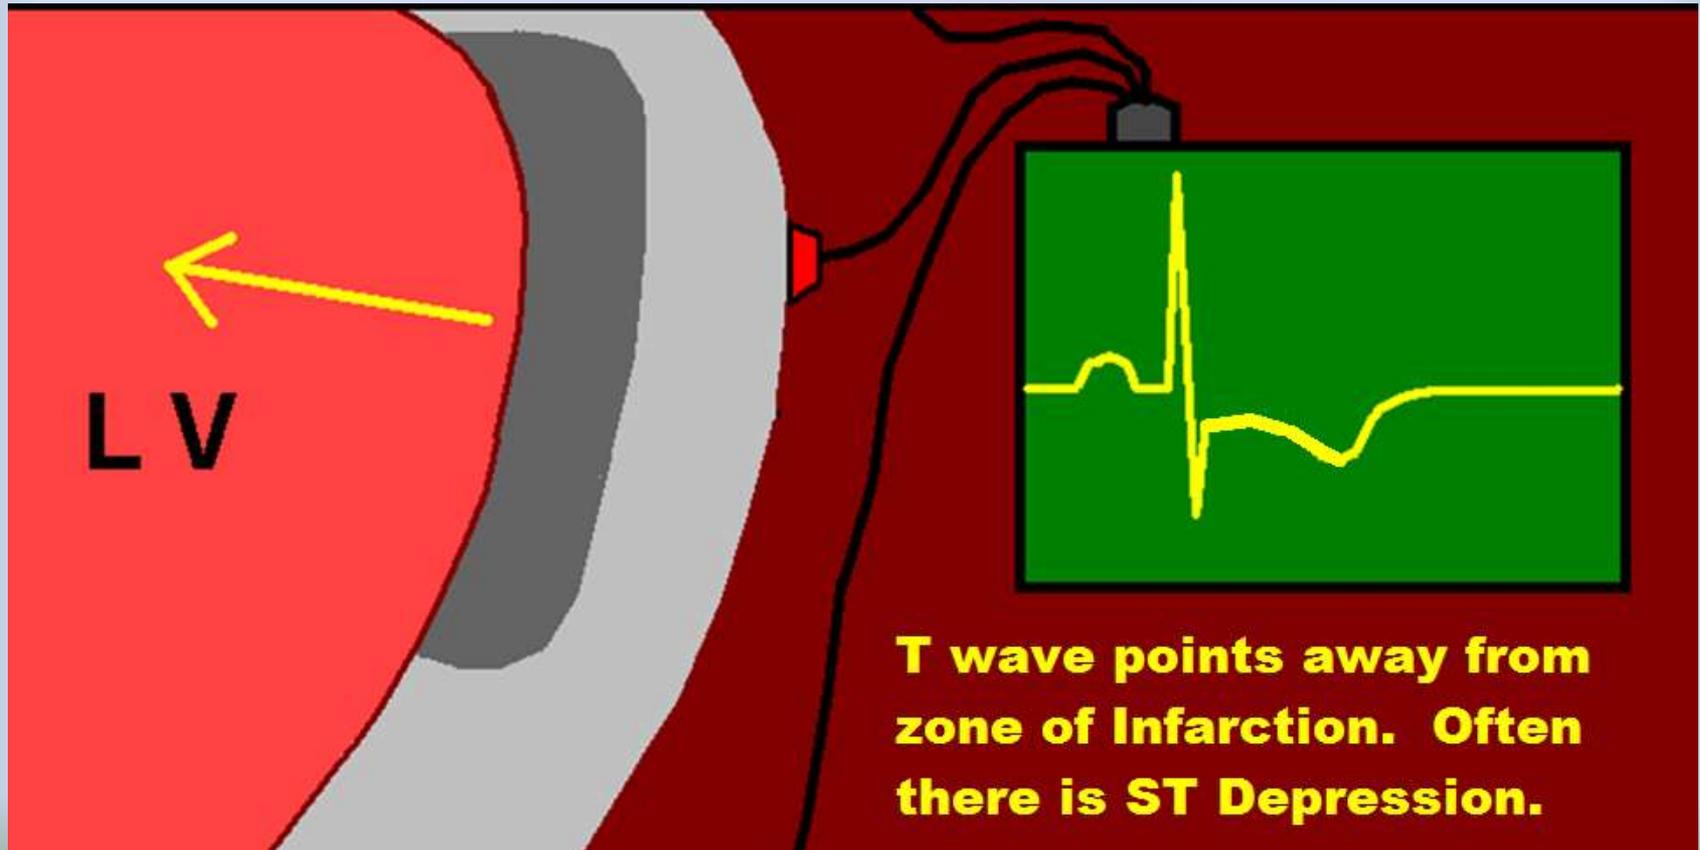

ST Depression in Leads V1 – V4:

- **Direct view of ISCHEMIA (anterior wall)**
- **Direct view of NSTEMI (anterior wall)**

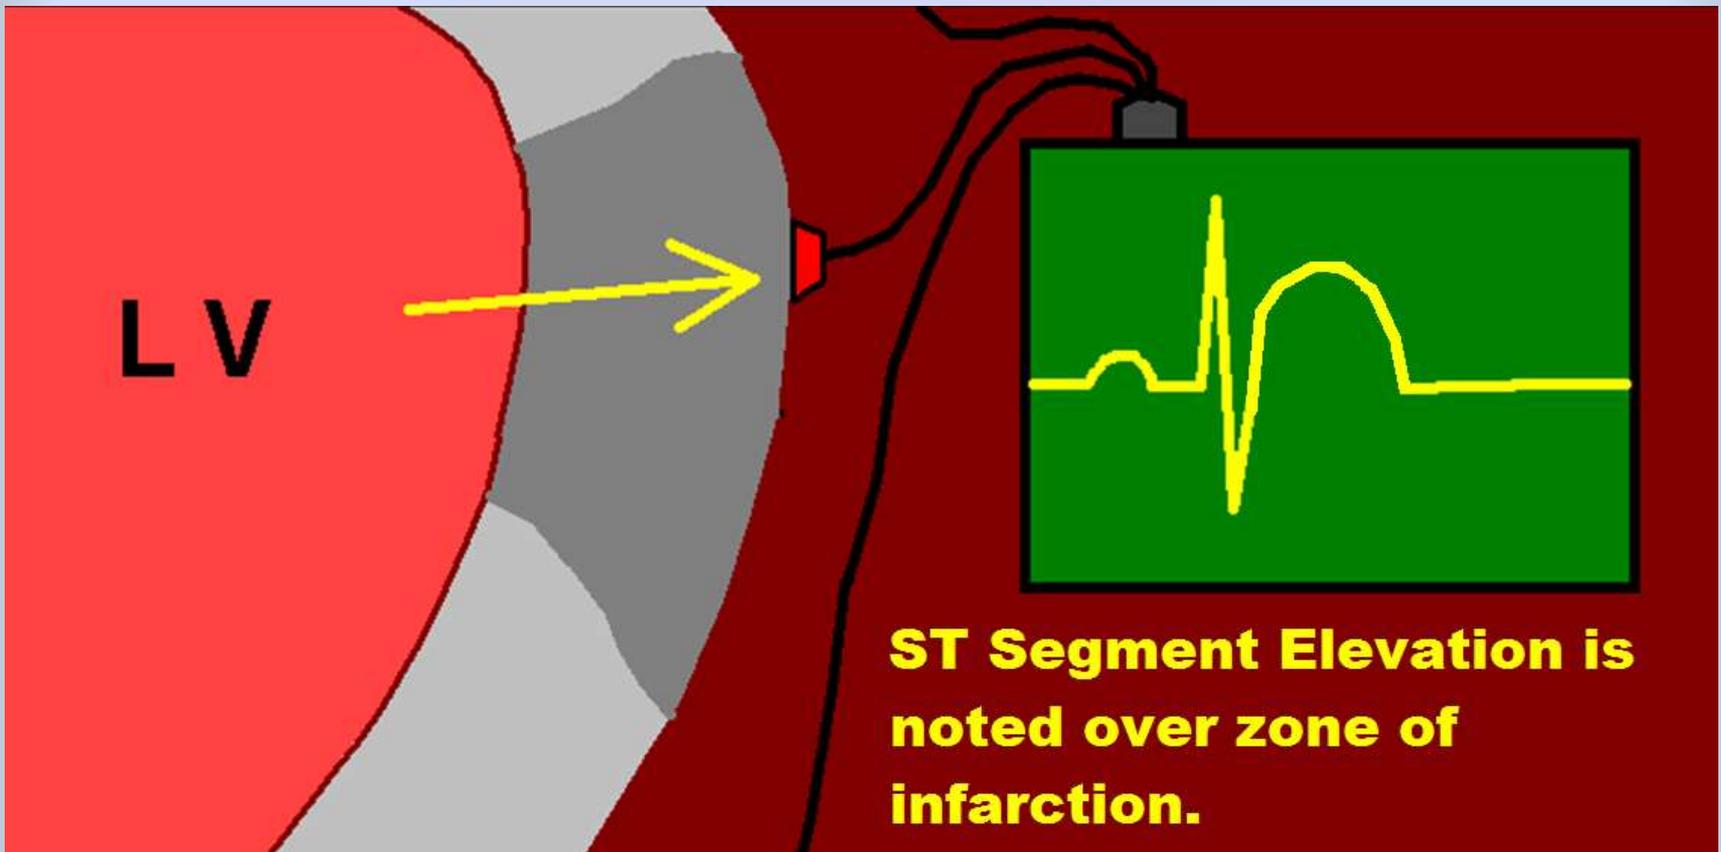

Non-STEMI (NSTEMI)

Non-ST Segment Elevation Myocardial Infarction.
“sub-endocardial MI” . . . “partial wall thickness”

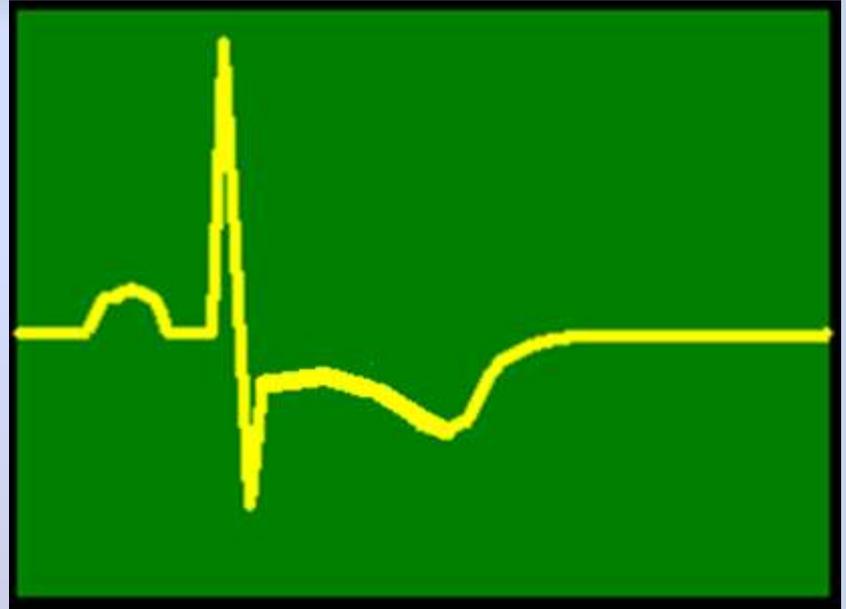

STEMI

- ST Segment Elevation Myocardial Infarction.

ST Depression in Leads V1 – V4:

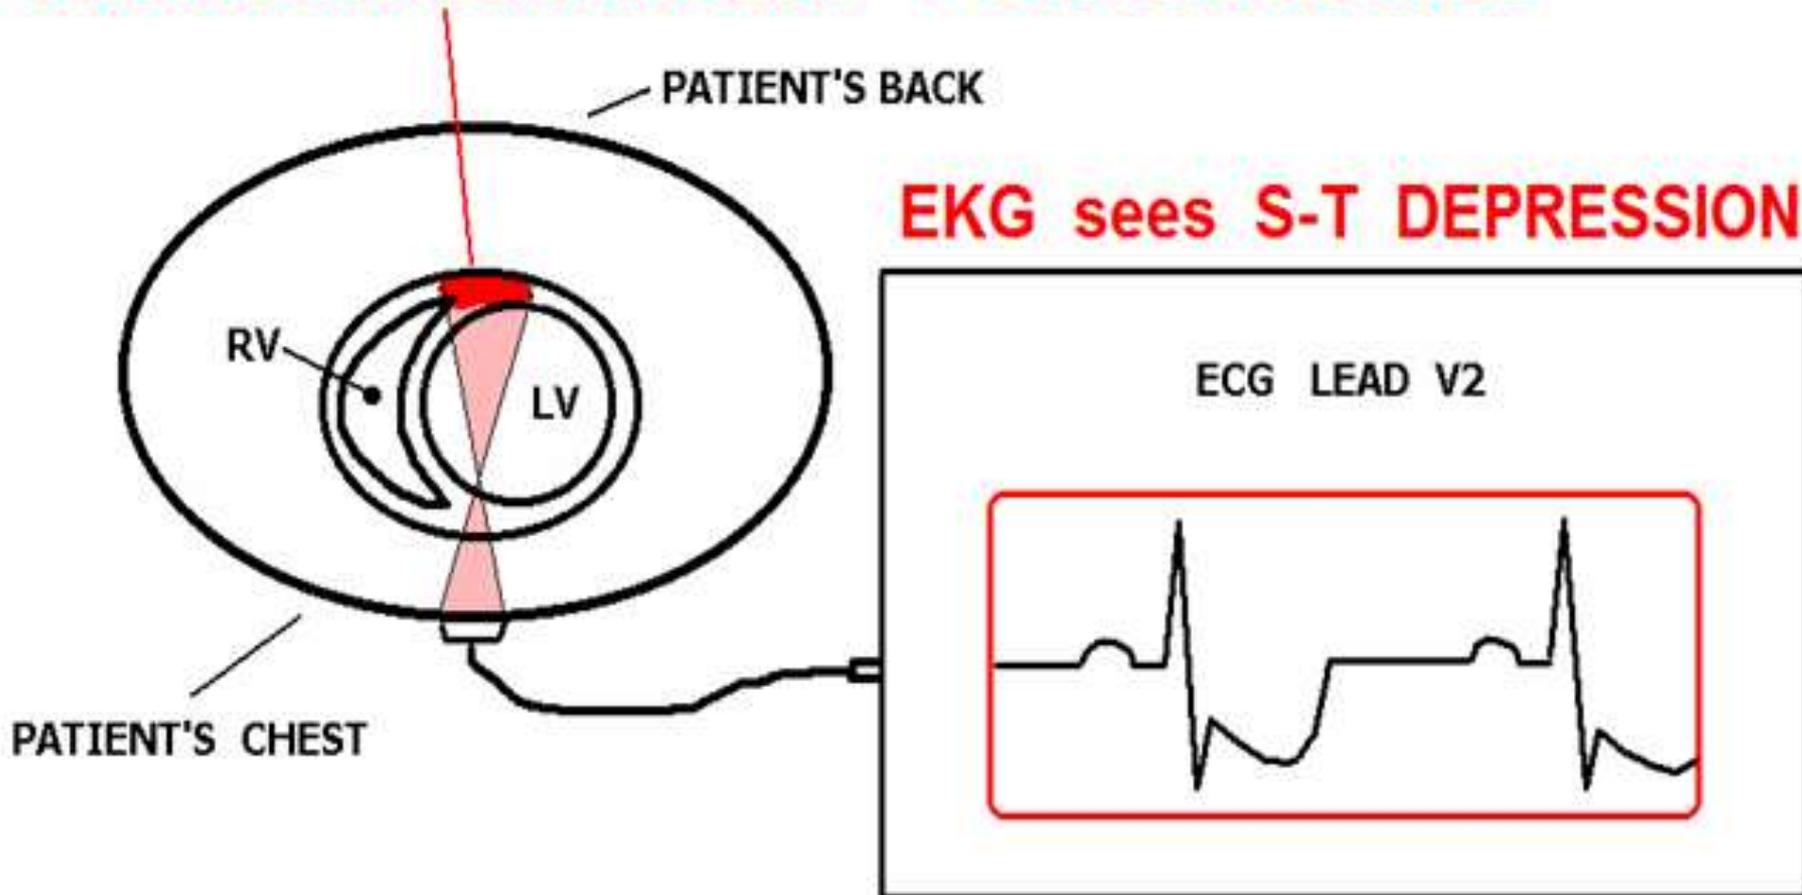

- Direct view of ISCHEMIA (anterior wall)
- Direct view of NSTEMI (anterior wall)
- Reciprocal view of STEMI (opposite side of heart - posterior wall)

HOW EKG VIEWS RECIPROCAL CHANGES

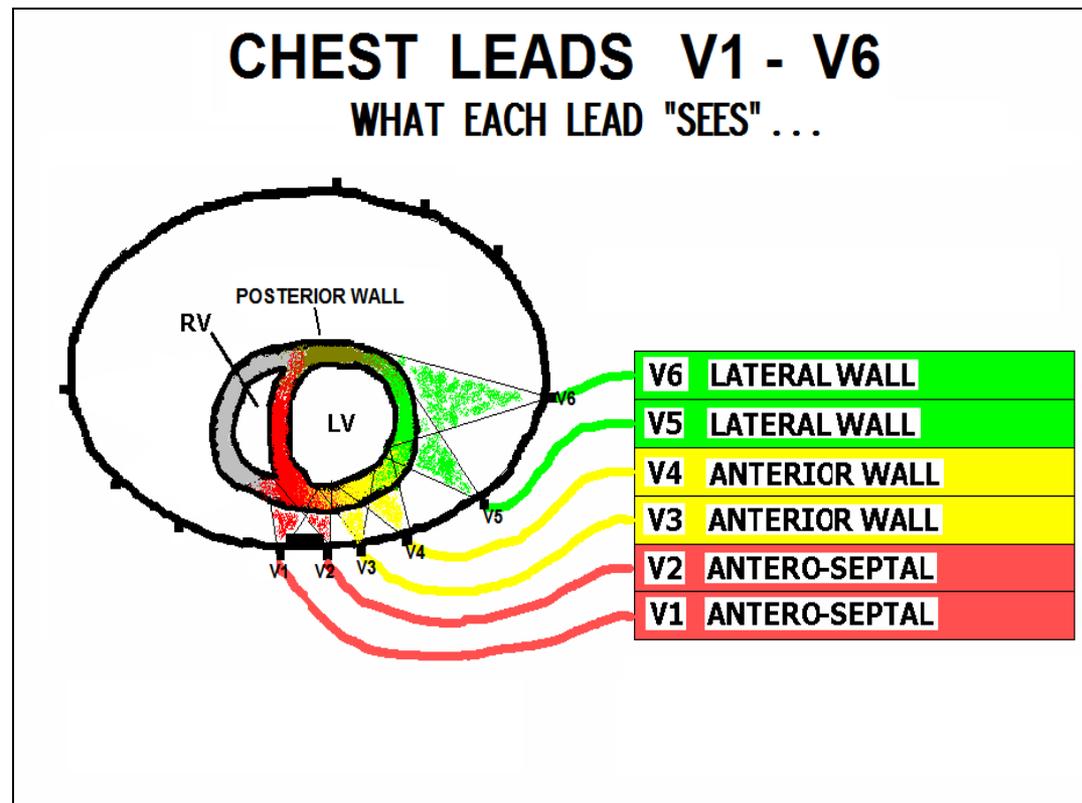

EXAMPLE:

AREA OF ACUTE INFARCTION - POSTERIOR WALL

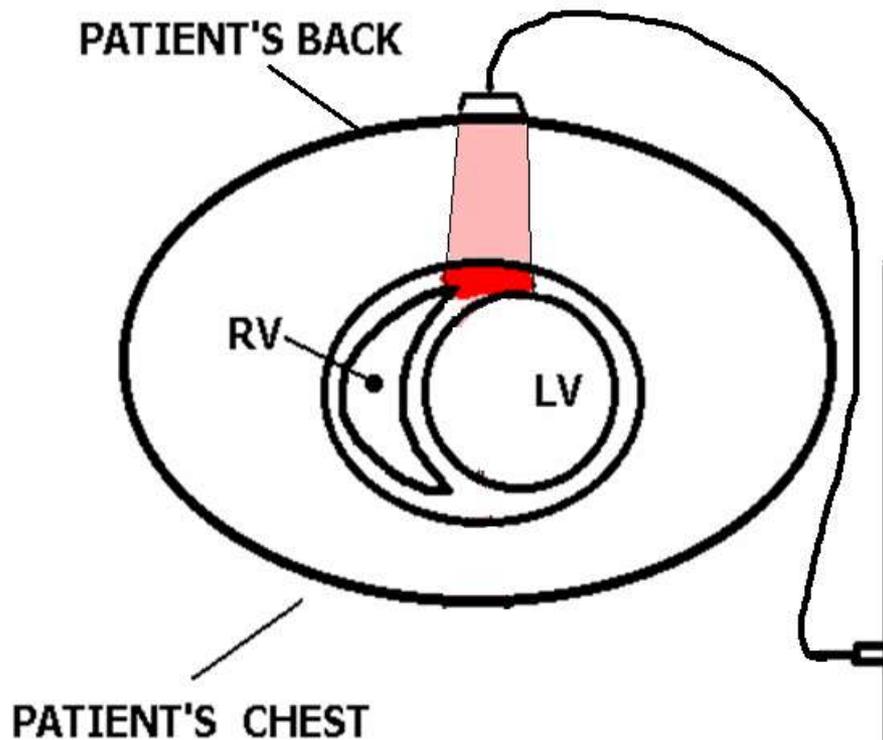

Posterior Wall STEMI....

- **Does not show ST elevation on standard 12 lead ECG** because NONE of the 12 leads view the Posterior Wall directly....

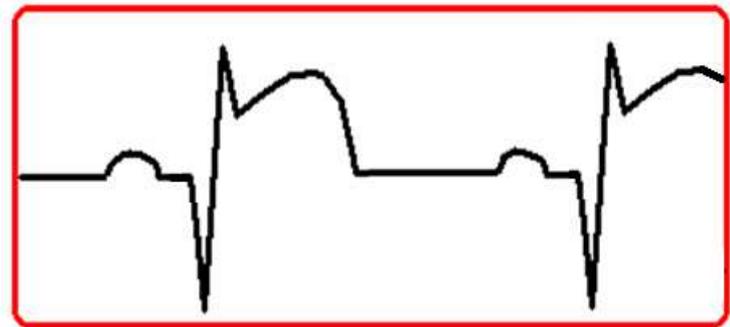

If we put ECG leads on the BACK of a PATIENT who is having an **ACUTE POSTERIOR WALL MI**

EKG sees S-T ELEVATION

ECG LEADS: V7, V8 or V9

Whenever you see
ST DEPRESSION in Leads V1 - V4

you must do a

POSTERIOR LEAD ECG

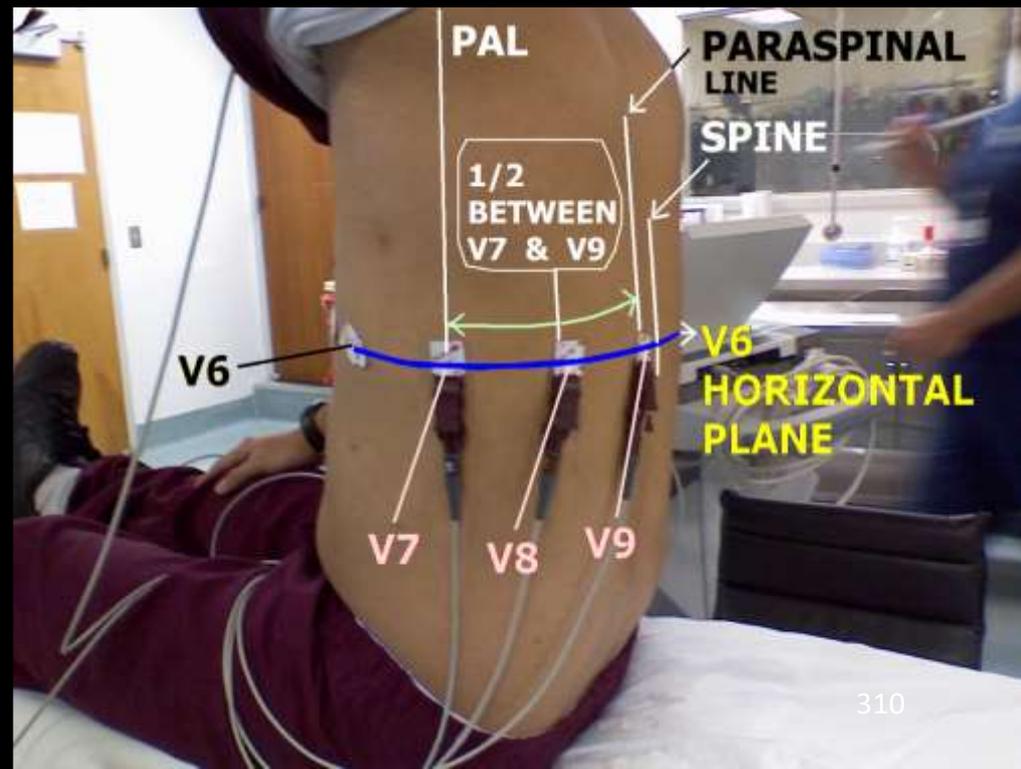

(V7 - V9)

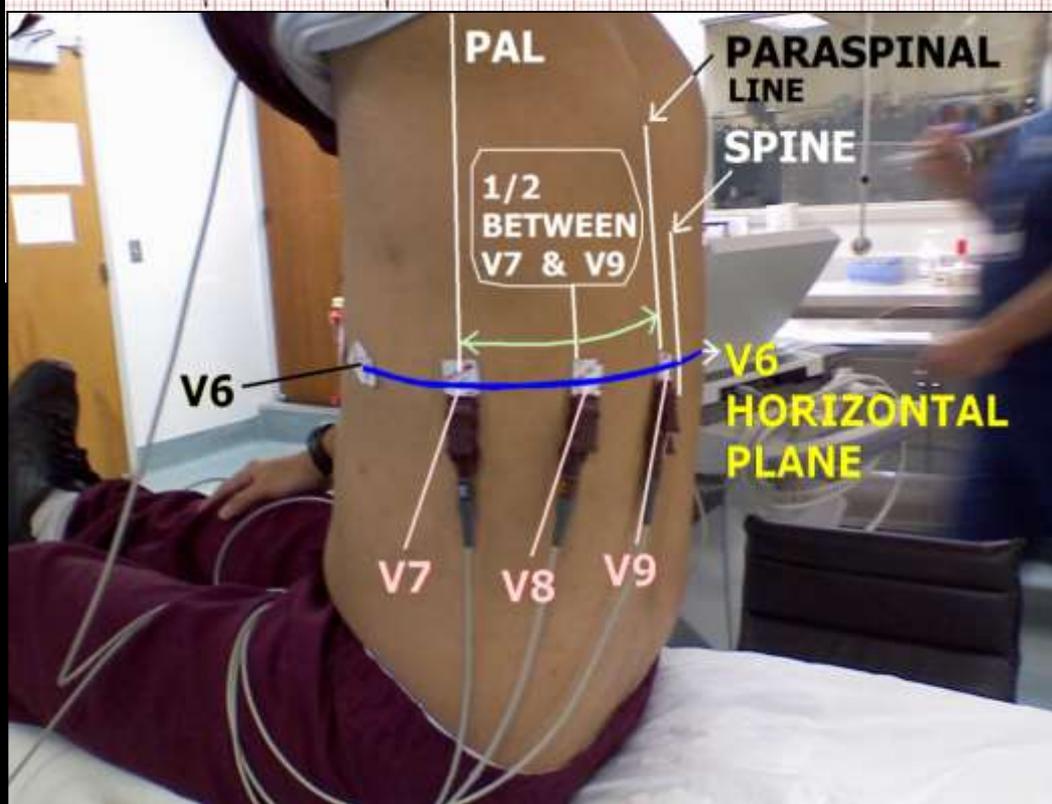

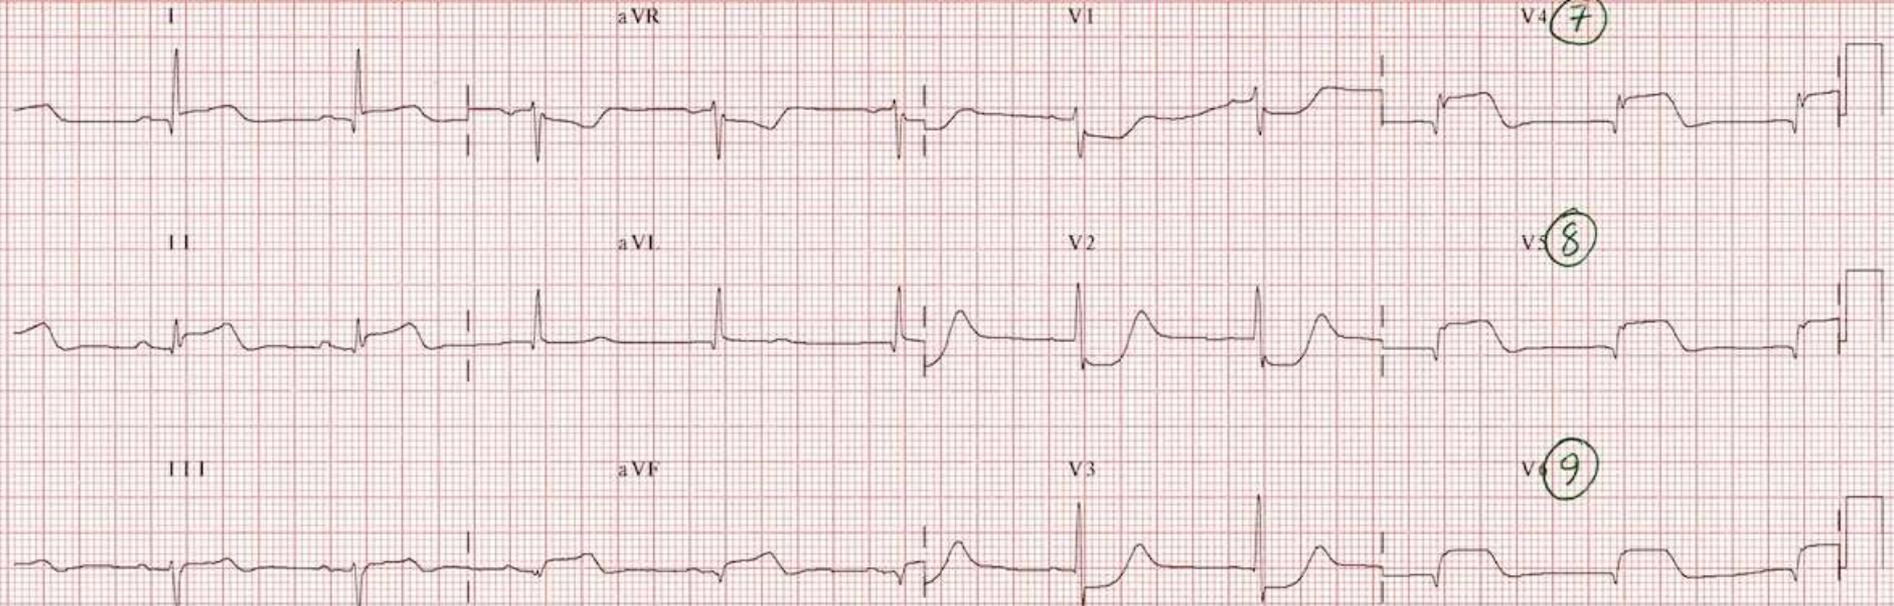

to see if you Patient is having a

POSTERIOR WALL STEMI

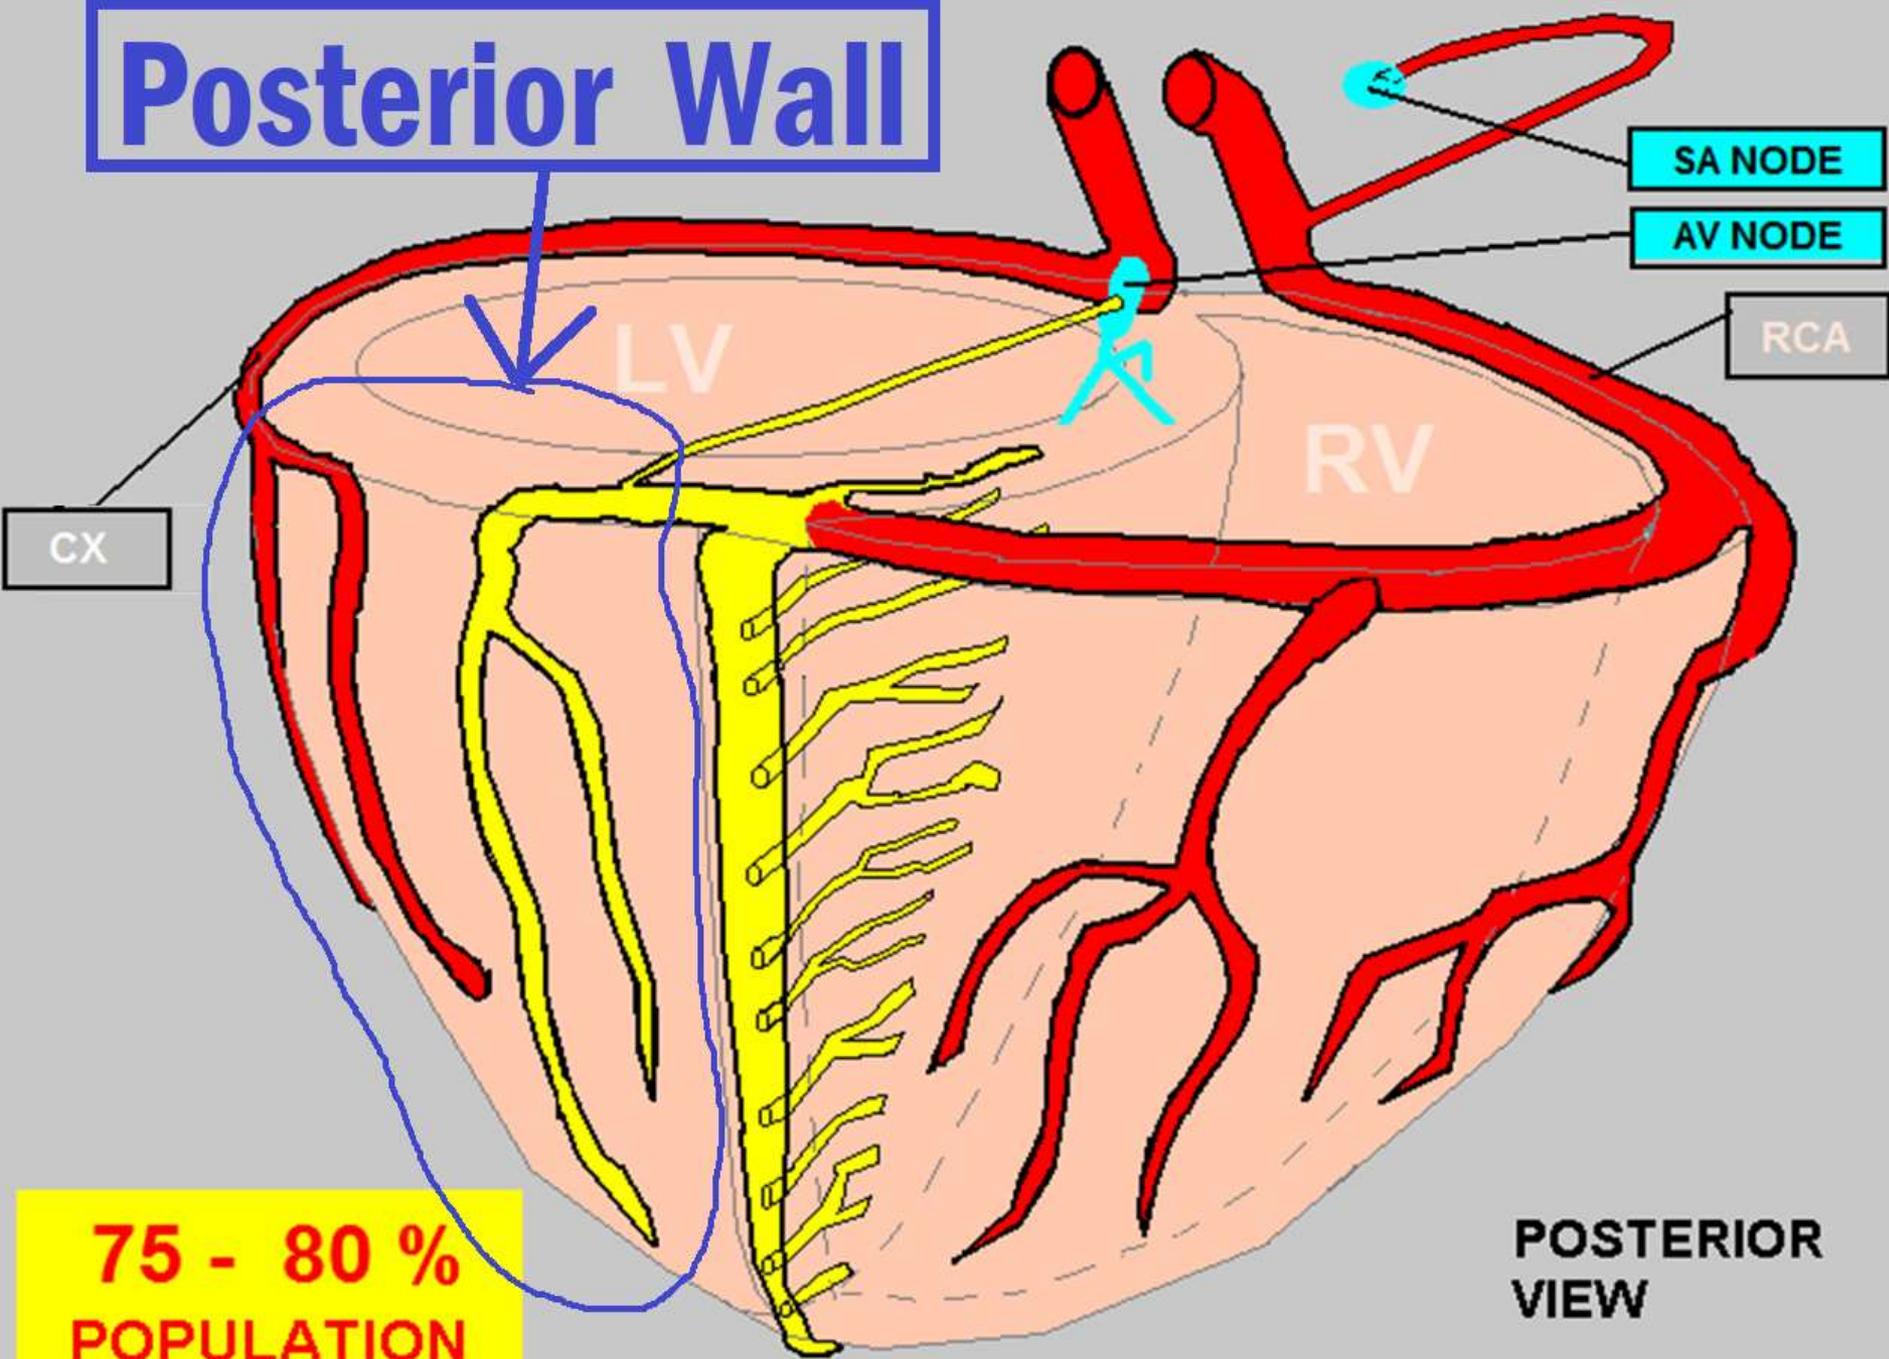

Whenever your patient's ECG exhibits ST DEPRESSION in any of the ANTERIOR LEADS (V1-V4), CONSIDER the possibility of POSTERIOR WALL STEMI !!

... To DIAGNOSE Posterior Wall STEMI, we should see LEADS V7 – V9 !!

Posterior Wall
