The Lifesaving 12 Lead ECG: Part 1

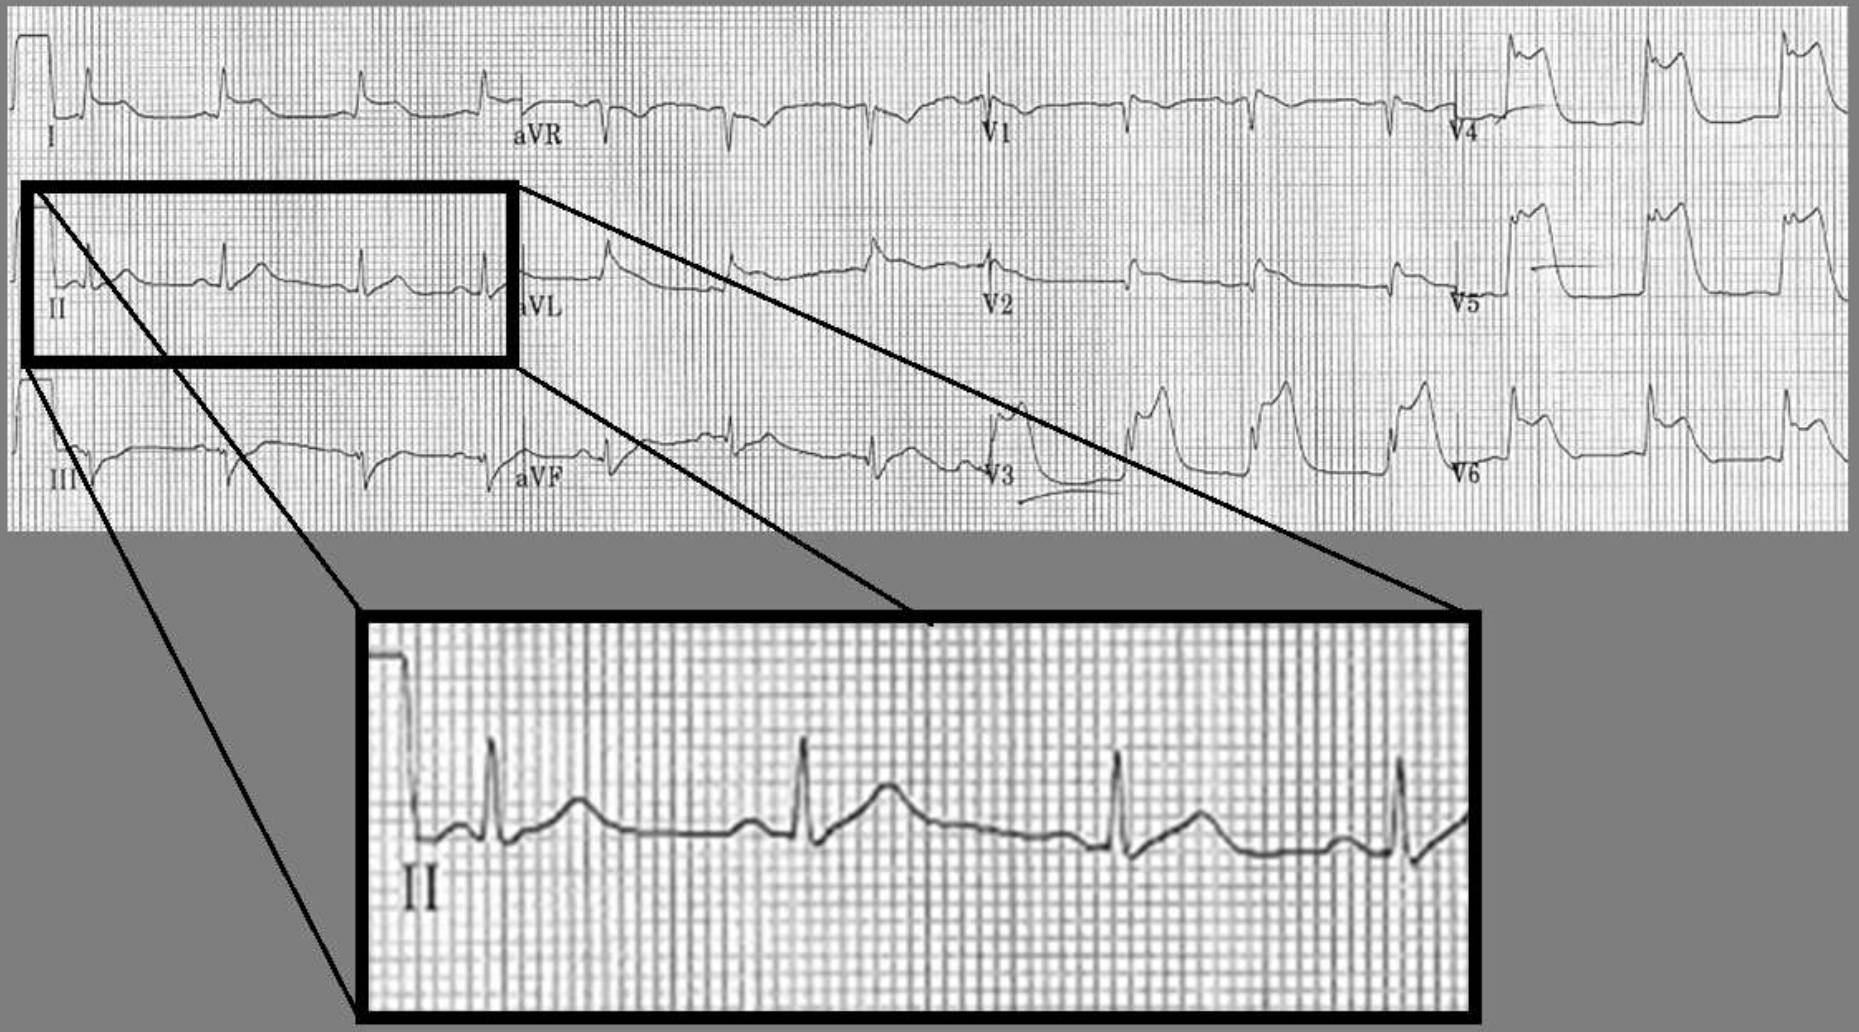
Wayne W Ruppert, CVT, CCCC, NREMT-P
Regional Director of Clinical Outreach &
Cardiovascular Accredited Programs:
Chest Pain Center, Heart Failure

Welcome !

Paramedics Christ Megoulas and Wayne Ruppert, Hershey, PA Fire Department, 1982

49 year old male - "Crushing chest pressure" . . . .

49 year old male - "Crushing chest pressure" . . . .



Wayne Ruppert - Bio:

- Cardiovascular Coordinator 2012-present (coordinated 4 successful accreditations)
- Interventional Cardiovascular / Electrophysiology Technologist, 1995-Present. (Approx 13,000 patients)
- Author of: "**12 Lead ECG Interpretation in Acute Coronary Syndrome with Case Studies from the Cardiac Cath Lab**," 2010, TriGen publishing / Ingram Books
- Author of: "**STEMI Assistant**," 2014, TriGen publishing / Ingram Books
- Florida Nursing CE Provider # 50-12998
- 12 Lead ECG Instructor, 1994-present (multiple hospitals, USF College of Medicine 1994)
- Website: www.ECGtraining.org

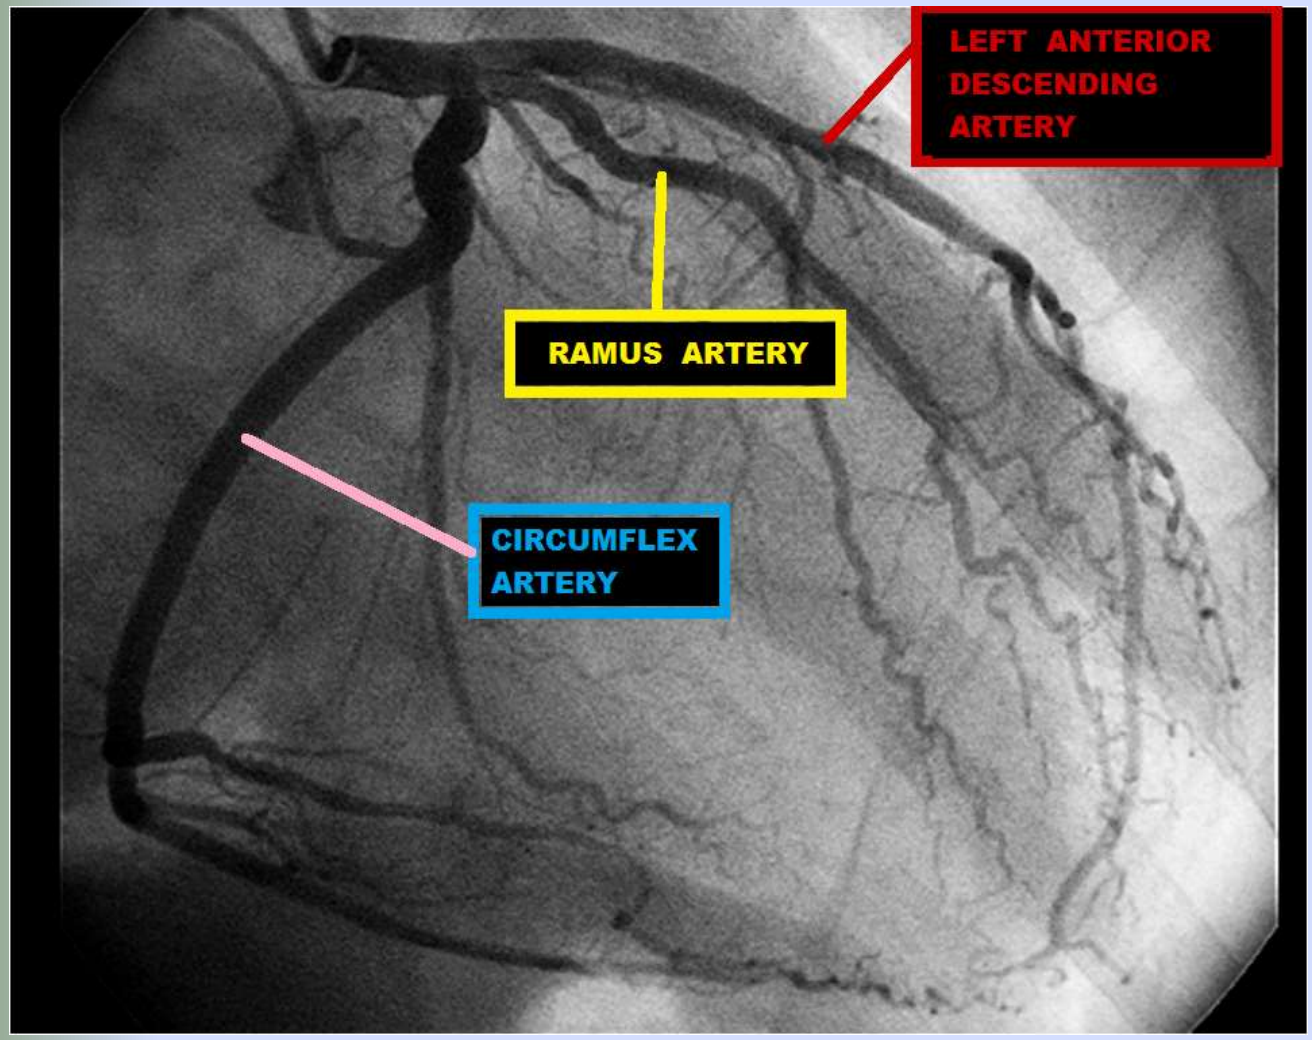
Source of Curriculum:

- Case Studies from Cardiac Catheterization and Electrophysiology Labs, 1996 – Present

13,000 – 15,000 EP and Cath Lab cases between 1996 - Today

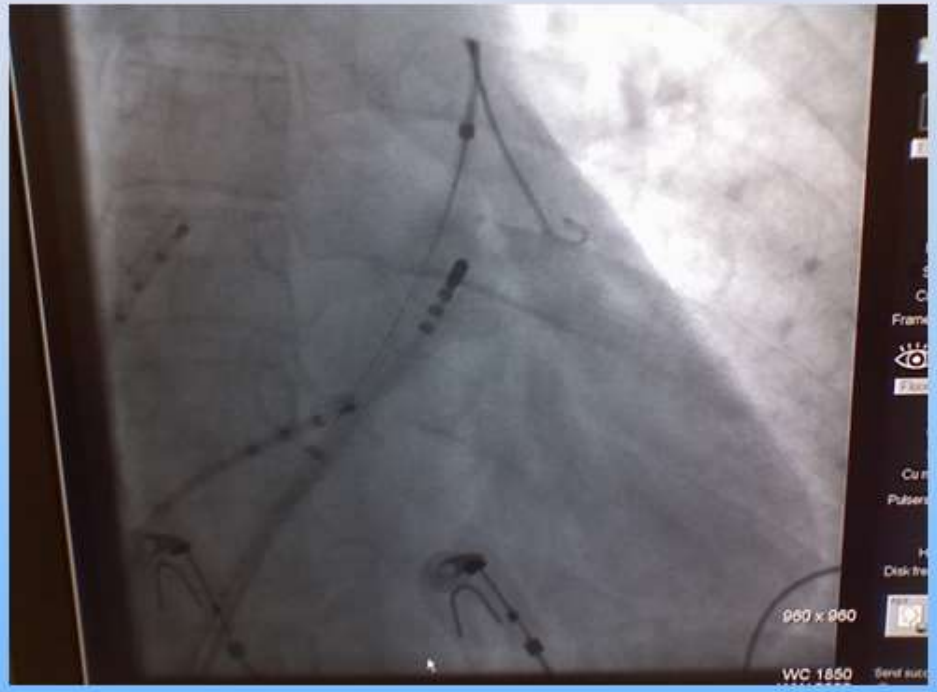
Wayne Ruppert and Dr. James Irwin, St Joseph's Hospital, Tampa, 7/29/2004

Cardiac Cath Lab Advantage:



Correlation of ECG leads with SPECIFIC cardiac anatomic structures.

Electrophysiology Lab Case Studies



EP Catheters within the heart used for obtaining the Electrogram (the "internal ECG") Tracing and for Pace-mapping, an integral component of an EP study

Author Wayne Ruppert conducting Pace-mapping during EP study at the St Joseph's Hospital Heart Institute, Pediatric Electrophysiology Program, Tampa, FL in 2004

EP Lab Advantage:

Correlation of ECG derived diagnosis with true intra-cardiac electrogram acquired diagnosis.

Source of Curriculum:

- Case Studies from Cardiac Catheterization and Electrophysiology Labs, 1996 – Present
- Current Evidence-based Research
  - Journal of the American College of Cardiology (JACC)
  - American Heart Association (AHA) Circulation
  - ACC/AHA Guidelines
  - New England Journal of Medicine

Source of Curriculum:

- Case Studies from Cardiac Catheterization and Electrophysiology Labs, 1996 – Present
- Current Evidence-based Research
  - Journal of the American College of Cardiology (JACC)
  - American Heart Association (AHA) Circulation
  - ACC/AHA Guidelines
  - New England Journal of Medicine
- Two peer reviewed, published textbooks

In the CARDIAC CATHETERIZATION LAB, we read our patients' 12 Lead ECGs and then evaluate their coronary arteries and ventricular function during angiography. Stated in plain English, ***we rapidly learn how to correlate 12 lead ECG findings with what's really going on inside our patients' hearts.*** Seeing ECGs from this perspective adds a new dimension to understanding the complex pathophysiologies of cardiovascular disease.

This book prepares you to:

- INTERPRET 12 Lead ECGs.
- ASSIMILATE DATA derived from the 12 Lead ECG into a comprehensive patient evaluation process designed to maximize diagnostic accuracy, while taking into consideration the 12 Lead ECGs inherent LACK of SENSITIVITY and SPECIFICITY.
- IDENTIFY 13 PATTERNS associated with myocardial ischemia and infarction, including the most subtle ECG changes often missed by clinicians and the ECG machine's computerized interpretation software.
- CORRELATE each lead of the ECG with specific regions of the heart – and the CORONARY ARTERIAL DISTRIBUTION that commonly supplies it. In cases of STEMI, this knowledge prepares you to ANTICIPATE the FAILURE OF CRITICAL CARDIAC STRUCTURES – often *BEFORE THEY FAIL*.

For those who need to master essential material quickly, this book has been written with an expedited learning" feature, *designed to make learning as easy as 1 2 3:*

1. **READ the YELLOW HIGHLIGHTED TEXT**
2. **STUDY the GRAPHIC IMAGES, PICTURES and ECGs**
3. **CORRECTLY ANSWER the REVIEW QUESTIONS at the end of each section.**

This is an invaluable resource for every medical professional who evaluates patients and reads their 12 lead ECGs:

- *Fellows in Emergency, Cardiology, and Family Medicine*
- *Medical Residents*
- *Veteran Physicians wanting a good review in ACS patient evaluation*
- *Physician Assistants and Nurse Practitioners*
- *Emergency Department Nurses*
- *Coronary Care Unit and Cardiac Telemetry Nurses*
- *Walk-in Clinic Physicians and Nurses*
- *Paramedics*

"I think this book will be a wonderful addition to the textbooks that are already available, with a fresh perspective'"

Joseph P. Ornato, MD, FACP, FACC, FACEP
- Professor and Chairman, Department of Emergency Medicine
Medical College of Virginia/Virginia Commonwealth University
- Medical Director, Richmond Ambulance Authority,
Richmond, Virginia

"This book integrates academic ECG principles with real-world clinical practice by incorporation of well chosen cath lab case studies into its curriculum. This combination lets readers see patients and their ECGs through the eyes of an experienced cath lab interventionalist, and provides a balanced approach to patient evaluation that compensates for the ECGs inherent lack of sensitivity and specificity. I highly recommend this book for all Emergency Medicine and Cardiology Fellows. For experienced clinicians, it's a superb review."

Humberto Coto, MD, FACP, FACC
- Chief of Interventional Cardiology
St. Joseph's Hospital
Tampa, Florida

COURSE PRE-REQUISITE:

You should already have Basic Single-Lead ECG Rhythm Strip Interpretation Skills.

THIS COURSE IS NOT A BASIC ECG RHYTHMS COURSE. If you are not already reasonably comfortable with interpreting and understanding basic ECG dysrhythmias (i.e.: heart blocks, A-Fib, V-Tach, etc.) we DO NOT recommend that you attend this workshop; instead we recommend our "Basic ECG Rhythms Workshop."

The Lifesaving 12 Lead ECG Course:

Is a condensed curriculum focused on acute conditions which are associated with a high degree of morbidity and mortality:

The Lifesaving 12 Lead ECG Course:

Is a condensed curriculum focused on acute conditions which are associated with a high degree of morbidity and mortality:

1. **Acute Coronary Syndromes**
   - **STEMI (pre-infarction, acute & evolving / old MI)**
   - **NSTEMI**
   - **Unstable Angina**
   - **Low Risk Chest Pain**

The Lifesaving 12 Lead ECG Course:

Is a condensed curriculum focused on acute conditions which are associated with a high degree of morbidity and mortality:

2. **Sudden Cardiac Death Syndromes**
   - **Long QT Syndrome (Congenital & Drug Induced)**
   - **Brugada Syndrome**
   - **Cardiomyopathy (Hypertrophic and other)**
   - **Arrhythmogenic Right Ventricular Dysplasia**
   - **Wolff-Parkinson-White Syndrome**
   - **Catecholinergic Polymorphic Ventricular Tachy.**

SUGGESTION *for optimal learning…….*

To get the most from this class:

- Do not try to write down or memorize every point.
- DOWNLOAD this PowerPoint in its entirety – review and study it at you own pace.
- For now …. Simply LISTEN to everything that is said. If it “makes sense,” then you’re learning.

SUGGESTION *for optimal learning…….*

To get the most from this class:

- Do not try to write down or memorize every point.
- DOWNLOAD this PowerPoint in its entirety – review and study it at you own pace.
- For now …. Simply LISTEN to everything that is said. If it "makes sense," then you're learning.
- In other words, *"just go along for the ride."*

The Lifesaving 12 Lead ECG Course:

Session 1 (morning session) Contents:

- Introduction and The ECG in Perspective
- Risk Stratification: The HEART Score
- Essential Cardiac A & P
  - Cellular (depolarization / repolarization)
  - Structural
- Heart Sounds and Valvular Function

The Lifesaving 12 Lead ECG Course:

Session 1 Contents, continued:

- **Bypass Tract Pathophysiology**
- **ECG Principles**
- **Coronary Artery Anatomy and Correlation with the 12 Lead ECG**
- **Waveforms and Intervals**
- **Bundle Branch Blocks**
- **Axis Deviation and Rotation**

The Lifesaving 12 Lead ECG Course:

Session 2 (afternoon session) Contents:

- **Sudden Cardiac Death Syndromes**
  - **Long QT**
  - **Hypertrophic Cardiomyopathy**
  - **Arrythmogenic Right Ventricular Cardiomyopathy**
  - **Brugada Syndrome**
- **Application of The HEART Score**
- **Acute Coronary Syndromes**

The EKG in PERSPECTIVE

1. Much development in the 1950s and 60s, and at that time, EKGs were the primary diagnostic tool.

2. Today we have better diagnostic tools (e.g. ECHO, CARDIAC CATH, EP STUDIES) that sometimes conflict with traditional EKG-made diagnoses.

3. Some EKG findings are more accurate and reliable than others .

AND . . .

Sometimes, ECGs LIE to us !

ECGs and USED CAR SALESMEN often have MUCH in common !

The EKG in PERSPECTIVE

PROBLEMS WITH EKGs . . .

↓ SENSITIVITY

(FALSE NEGATIVES)

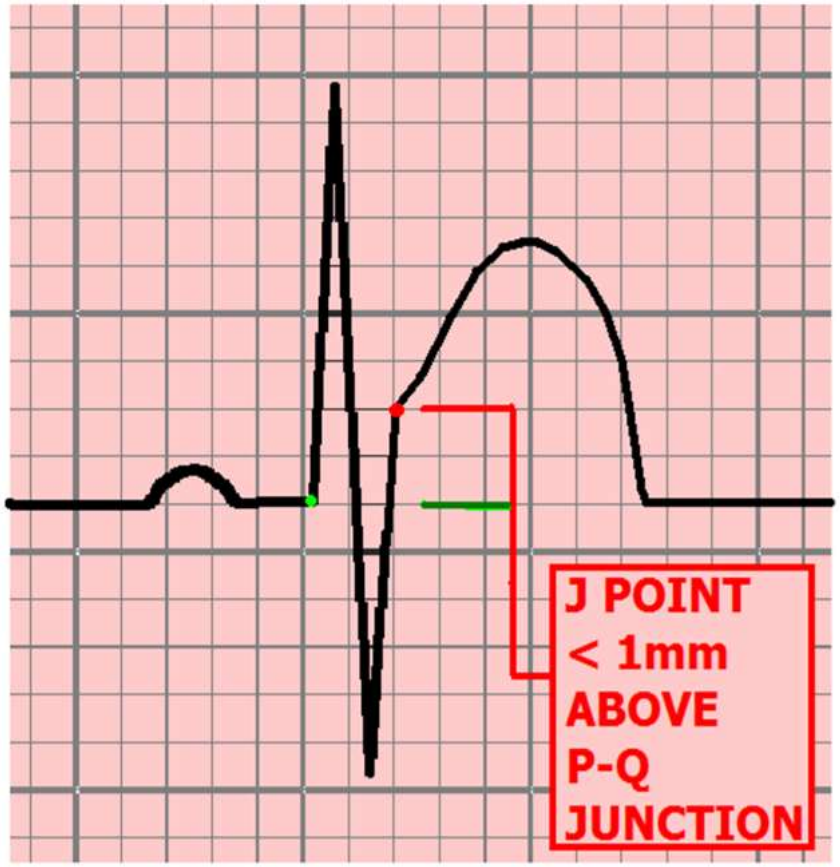
↓ SPECIFICITY

(FALSE POSITIVES)

AND . . .

PROBLEMS WITH SPECIFICITY . . .

S-T SEGMENT ELEVATION - COMMON ETIOLOGIES:



CONDITION:

- ACUTE INFARCTION
- HYPERKALEMIA
- BRUGADA SYNDROME
- PULMONARY EMBOLUS
- INTRACRANIAL BLEED
- MYOCARDITIS / PERICARDITIS
- L. VENT. HYPERTROPHY
- PRINZMETAL'S ANGINA
- L. BUNDLE BRANCH BLOCK
- PACED RHYTHM
- EARLY REPOLARIZATION & "MALE PATTERN" S-T ELEV.

ST-Segment Elevation in Normal Circumstances and in Various Conditions

Table 1. ST-Segment Elevation in Normal Circumstances and in Various Conditions.

Condition	Features
Normal (so-called male pattern)	Seen in approximately 90 percent of healthy young men; therefore, normal Elevation of 1–3 mm Most marked in V_2 Concave
Early repolarization	Most marked in V_4, with notching at J point Tall, upright T waves Reciprocal ST depression in aVR, not in aVL, when limb leads are involved
ST elevation of normal variant	Seen in V_3 through V_4 with inverted T waves Short QT, high QRS voltage
Left ventricular hypertrophy	Concave Other features of left ventricular hypertrophy
Left bundle-branch block	Concave ST-segment deviation discordant from the QRS
Acute pericarditis	Diffuse ST-segment elevation Reciprocal ST-segment depression in aVR, not in aVL Elevation seldom >5 mm PR-segment depression
Hyperkalemia	Other features of hyperkalemia present: Widened QRS and tall, peaked, tented T waves Low-amplitude or absent P waves ST segment usually downsloping
Brugada syndrome	rSR' in V_1 and V_2 ST-segment elevation in V_1 and V_2, typically downsloping
Pulmonary embolism	Changes simulating myocardial infarction seen often in both inferior and anteroseptal leads
Cardioversion	Striking ST-segment elevation, often >10 mm, but lasting only a minute or two immediately after direct-current shock
Prinzmetal's angina	Same as ST-segment elevation in infarction, but transient
Acute myocardial infarction	ST segment with a plateau or shoulder or upsloping Reciprocal behavior between aVL and III

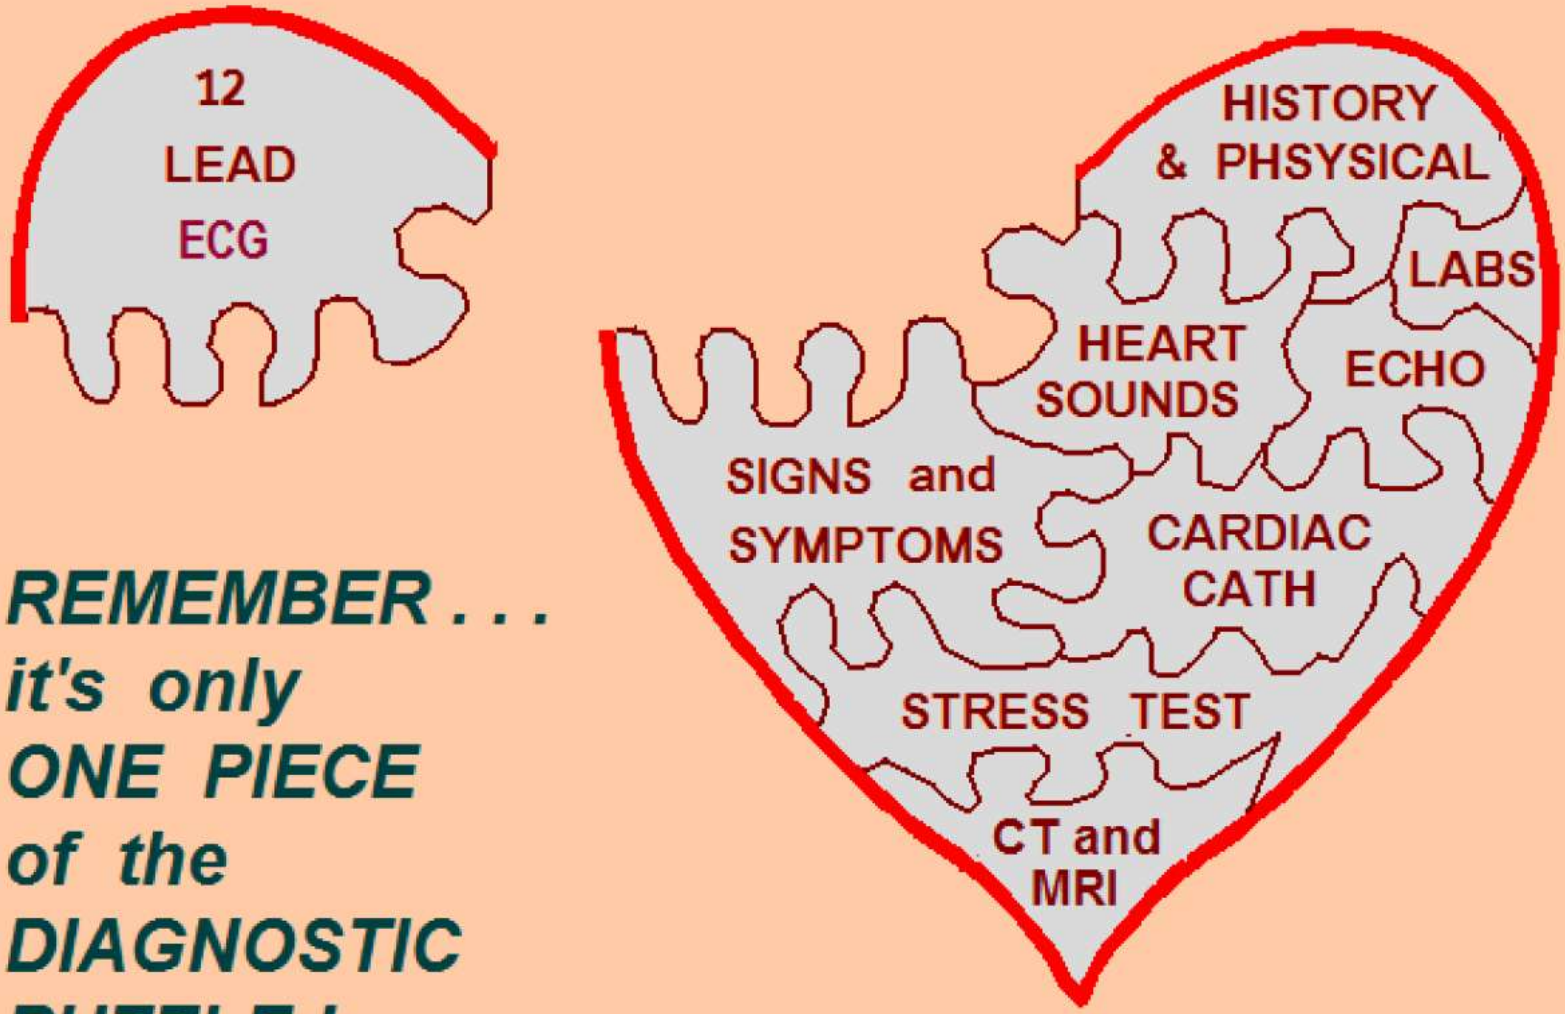
"From time to time, the EKG – derived diagnosis will be ***TOTALLY INCORRECT****."*

Despite the ECG's problematic issues with
Lack of Sensitivity
&
Lack of Specificity,
The 12 Lead ECG remains one of our QUICKEST, most cost-efficient front-line Triage Tools that we have today.

REMEMBER . . . . Keep the ECG Results in PROPER PERSPECTIVE . . . .



REMEMBER . . .
it's only
ONE PIECE
of the
DIAGNOSTIC
PUZZLE !

So how do we know when the ECG is telling us the truth ???

- ***We utilize ACS Risk Stratification to compensate for the ECG's lack of sensitivity and specificity, to aid us in clinical decision-making and to improve our diagnostic accuracy.***

HEART

HEART score for chest pain patients			
History	Highly suspicious	2	
	Moderately suspicious	1	
	Slightly suspicious	0	
ECG	Significant ST-deviation	2	
	Non specific repolarisation disturbance / LBTB / PM	1	
	Normal	0	
Age	≥ 65 years	2	
	> 45 and < 65 years	1	
	≤ 45 years	0	
Risk factors	≥ 3 risk factors or history of atherosclerotic disease*	2	
	1 or 2 risk factors	1	
	No risk factors known	0	
Troponin	≥ 3x normal limit	2	
	> 1 and < 3x normal limit	1	
	≤ 1x normal limit	0	
		Total	

***Risk factors for atherosclerotic disease:**

Hypercholesterolemia	Cigarette smoking
Hypertension	Positive family history
Diabetes Mellitus	Obesity

C-Statistic scores achieved in this study:

HEART:	0.83
TIMI:	0.75
GRACE:	0.70

C-Statistic interpretation:

A score of "1.00" would mean the score predicts outcome with 100% perfection. A score of 0.50 is the same as a "50/50 coin toss." A score of LESS THAN 0.50 means that the score predicts the opposite outcome.

US HEART Score Validation

CARDIAC ANATOMY and PHYSIOLOGY "101"

CARDIAC CELLS AT REST have POSITIVE charged IONS on the OUTSIDE of the cell membrane, and NEGATIVE charged IONS on the INSIDE

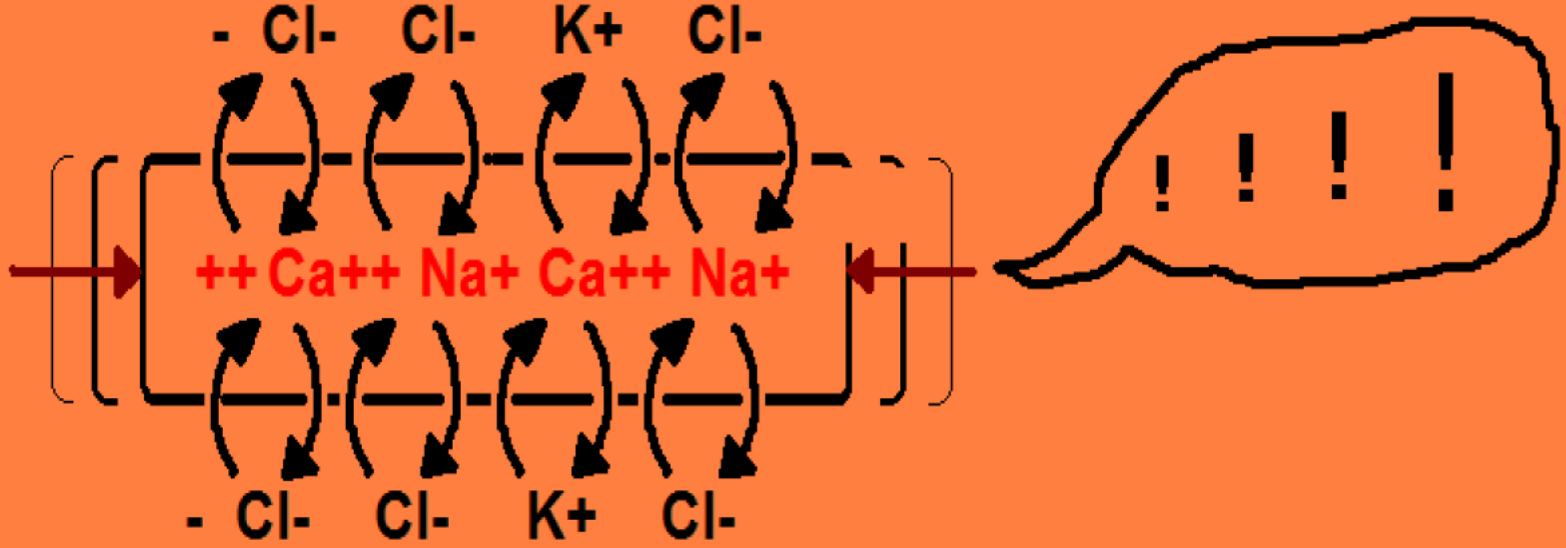
Ca++ Na+ Ca++ Na+ Ca++

Cl- Cl- K+ Cl- K+ Cl- K+ Cl-

Ca++ Na+ Ca++ Na+ Ca++

CARDIAC ANATOMY and PHYSIOLOGY "101"

. . . when the IONS shift . . . that is, the POSITIVE IONS that were on the outside TRADE PLACES with the NEGATIVE IONS that were on the INSIDE . . . .



. . . THE CELL CONTRACTS!

CARDIAC ANATOMY and PHYSIOLOGY "101"

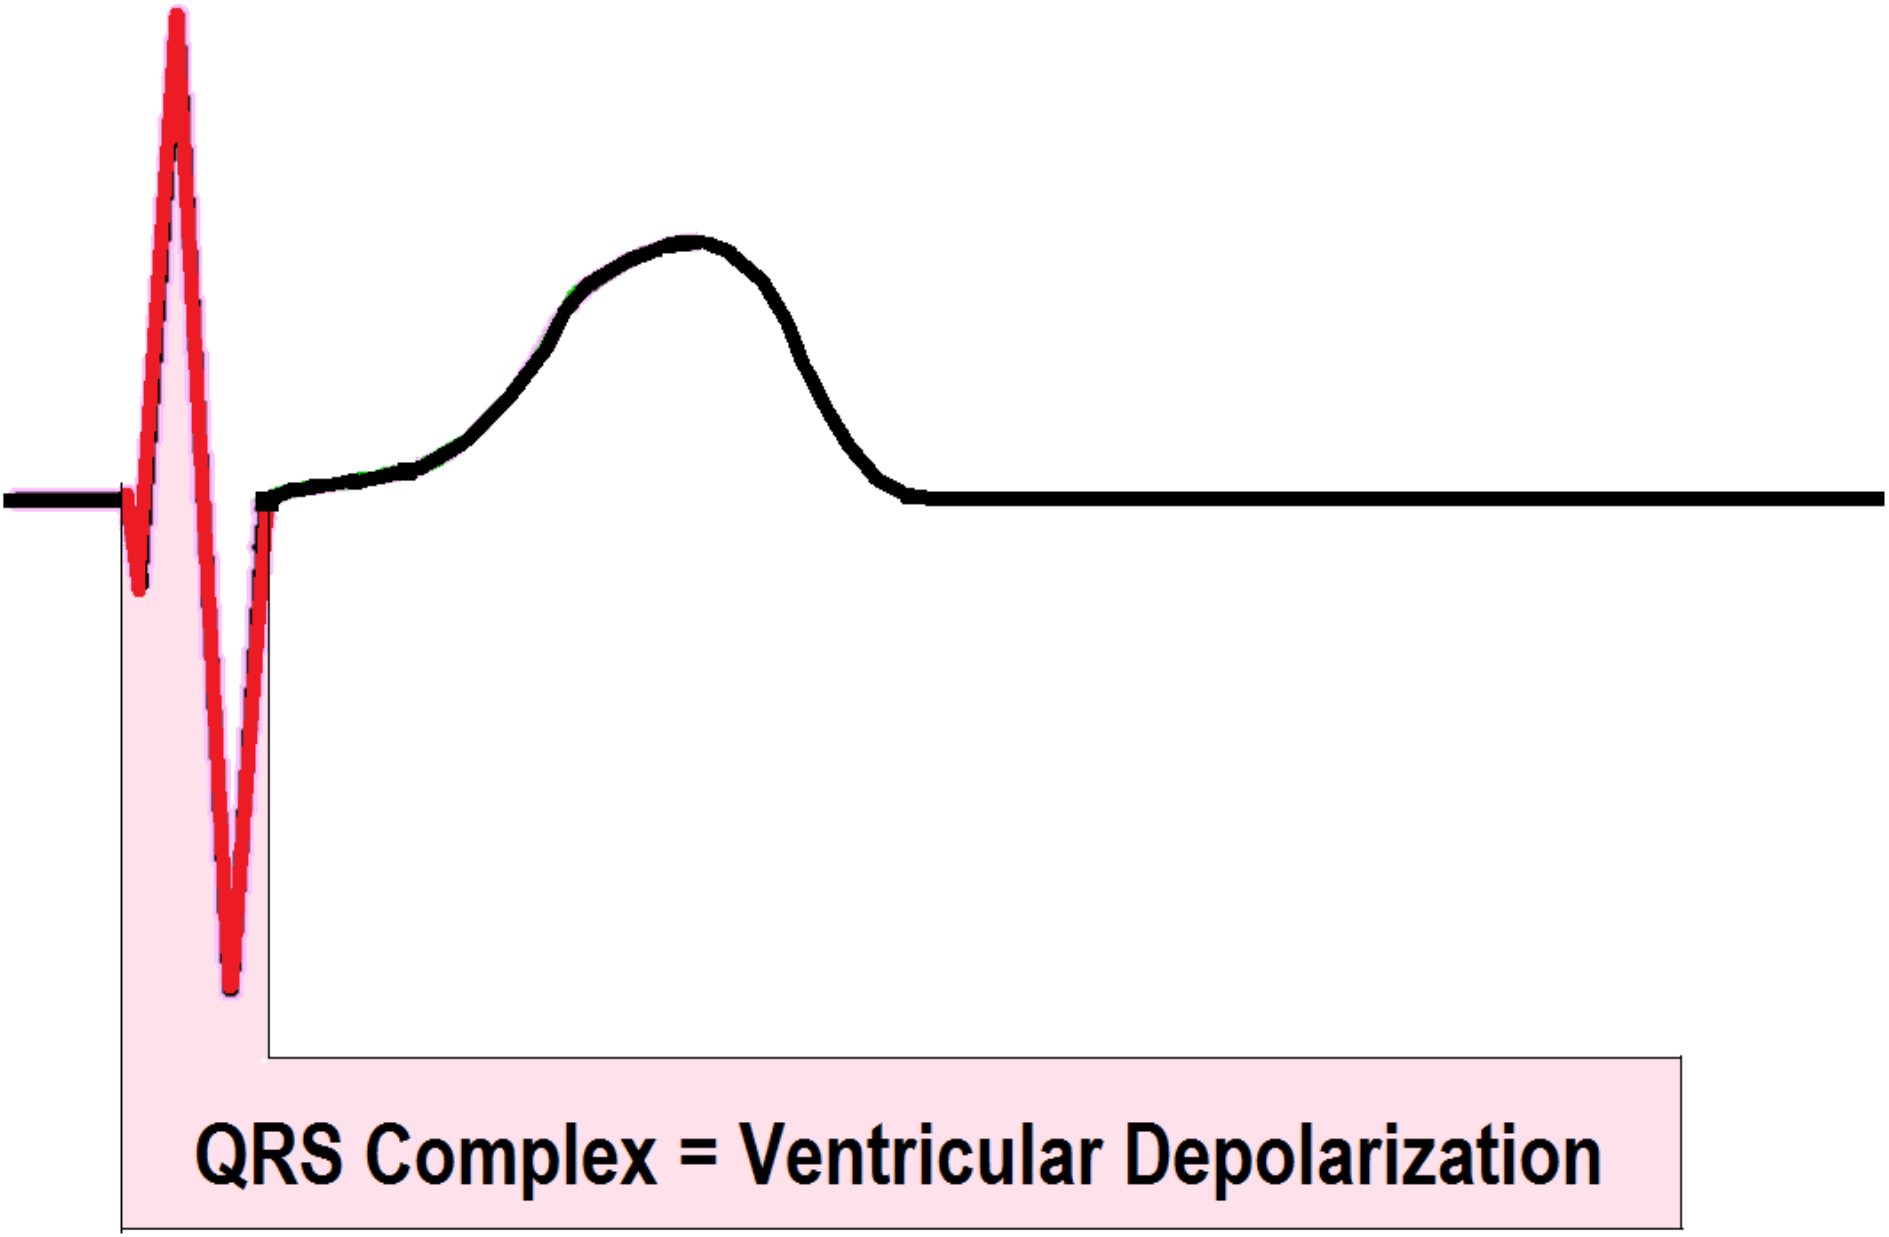
THIS (OF COURSE) IS KNOW AS . . .

DEPOLARIZATION

WHEN EVERYTHING IS WORKING PROPERLY, THE WAVE OF DEPOLARIZING CELLS CAUSES THE HEART TO CONTRACT, AND PUMP BLOOD TO THE LUNGS AND THE SYSTEMIC CIRCULATION

Ventricular Depolarization:

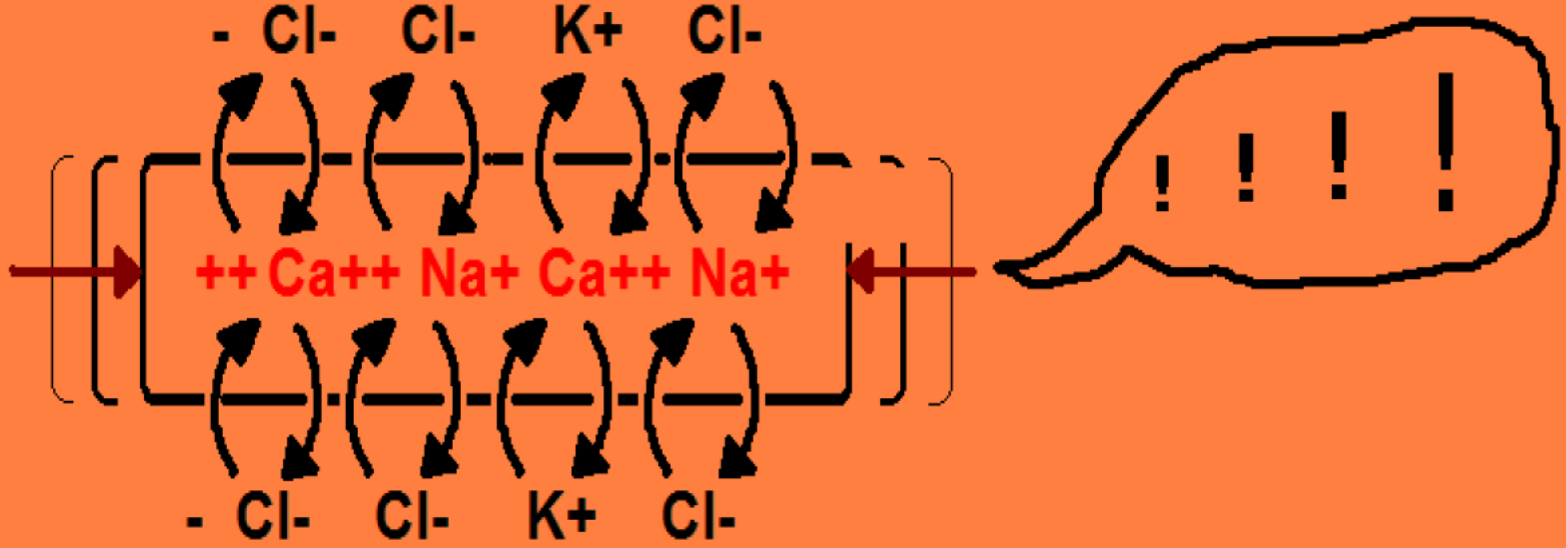
- Is represented by the **QRS Complex**



QRS Complex = Ventricular Depolarization

CARDIAC ANATOMY and PHYSIOLOGY "101"

. . . when the IONS shift . . . that is, the POSITIVE IONS that were on the outside TRADE PLACES with the NEGATIVE IONS that were on the INSIDE . . . .



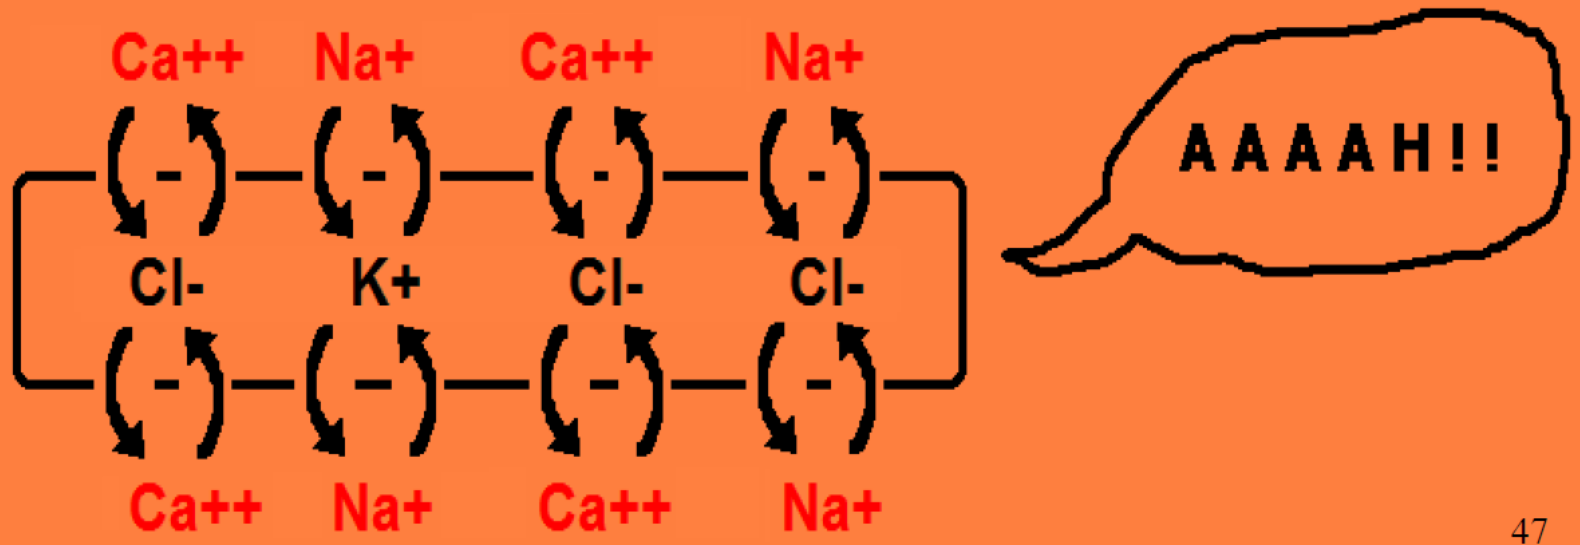
. . . THE CELL CONTRACTS!

CARDIAC ANATOMY and PHYSIOLOGY "101"

AFTER DEPOLARIZATION, THE CELLS RELAX.

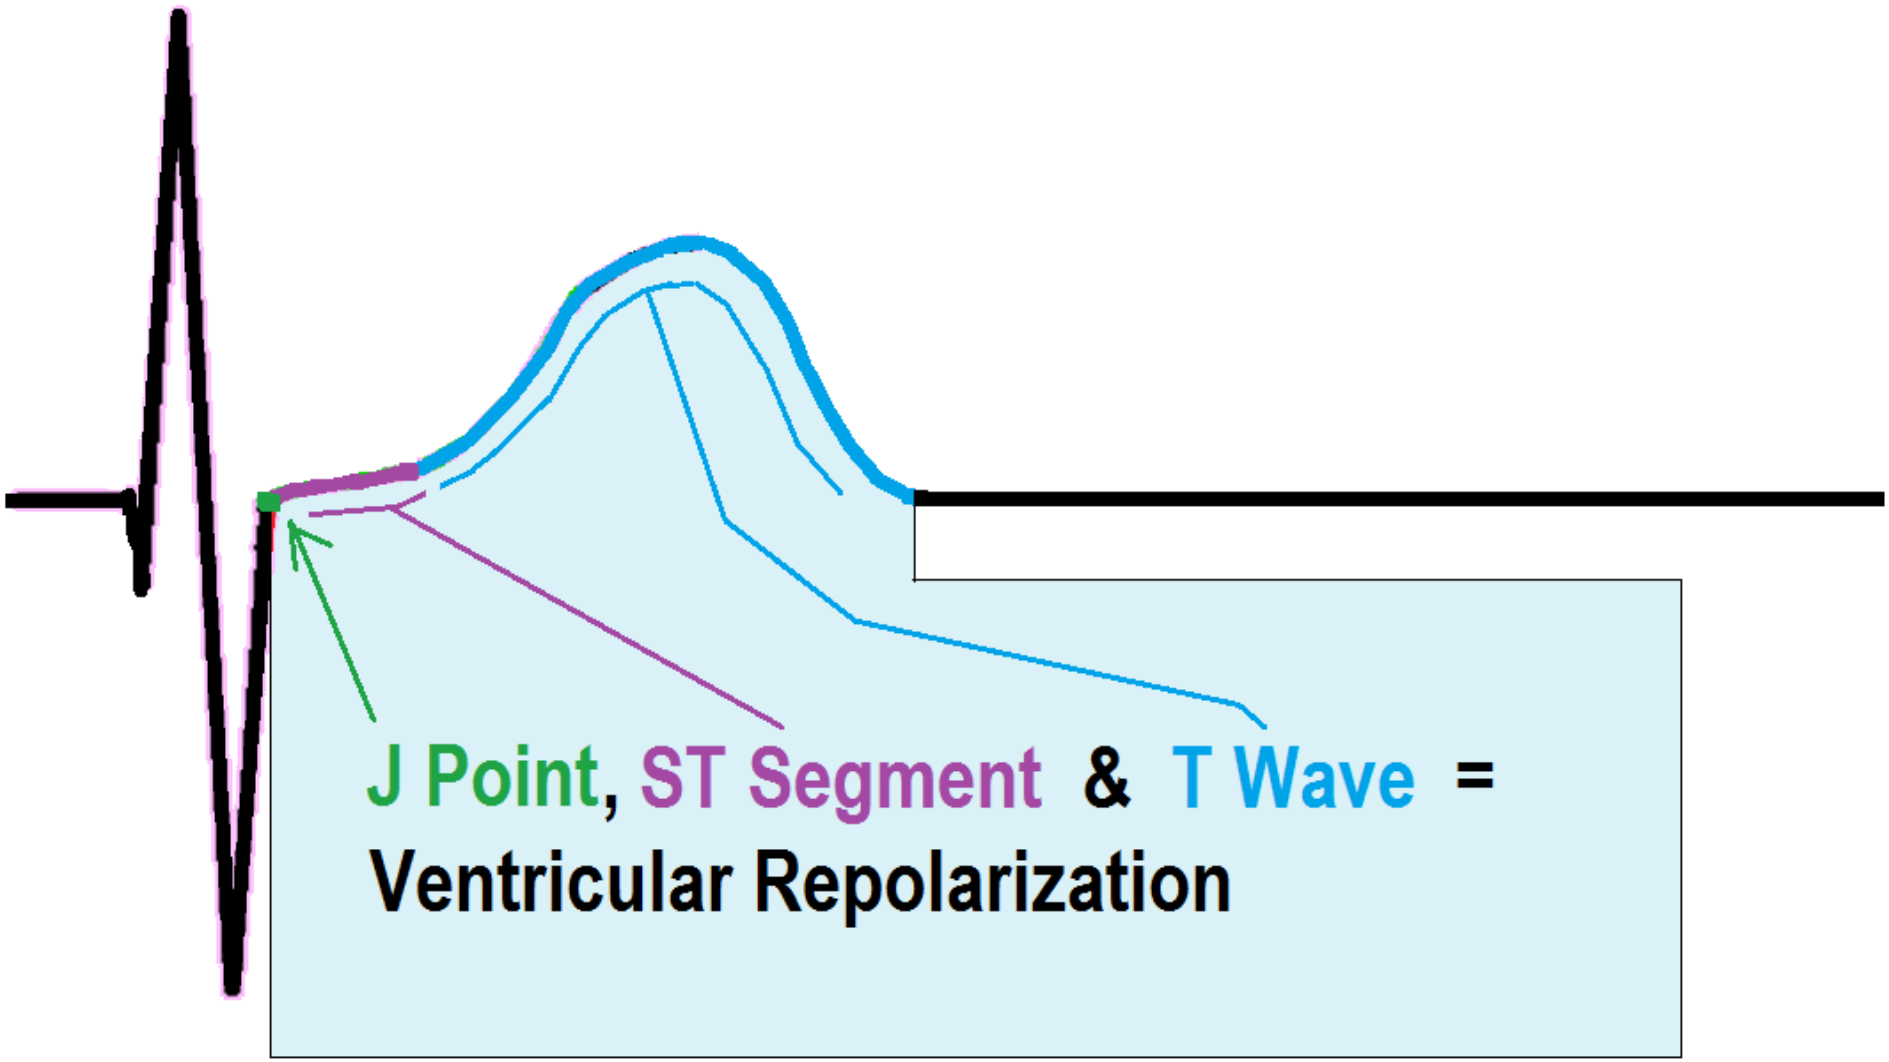
THE IONS RETURN TO THEIR ORIGINAL POSITIONS --

THIS PROCESS IS KNOWN AS REPOLARIZATION



Repolarization on the ECG:

- Is represented by the:
  - **J Point**
  - **ST Segment**
  - **T Wave**



J Point, ST Segment & T Wave =
Ventricular Repolarization

From the QRS to the end of the T Wave = QT Interval !

  - CALCIUM CHANNELS CLOSE

THE ACTION POTENTIAL
(OF VENTRICULAR MUSCLE CELLS)
IS ROUGHLY EQUAL TO THE Q - T INTERVAL

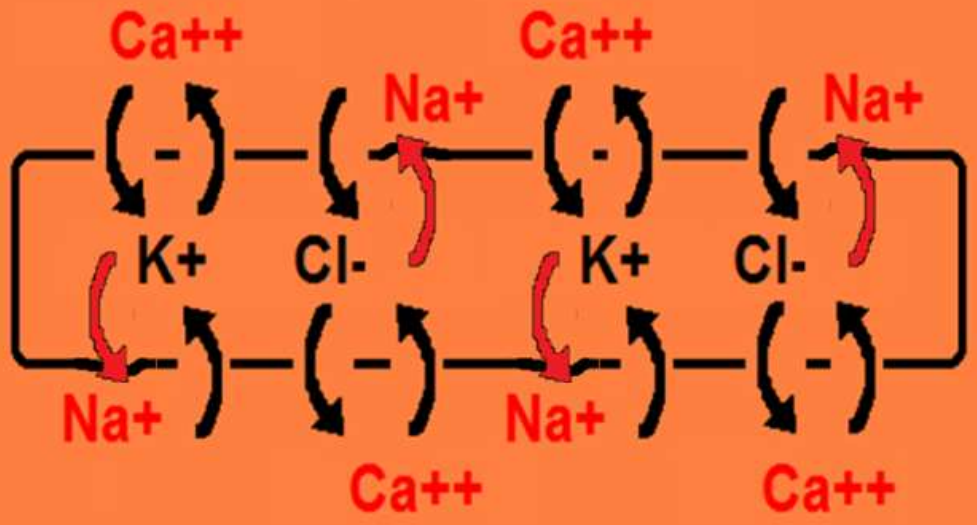
QT Prolongation

- **Congenital** malformation of ion channels
- **Medications** or other substances alter Ion channel function

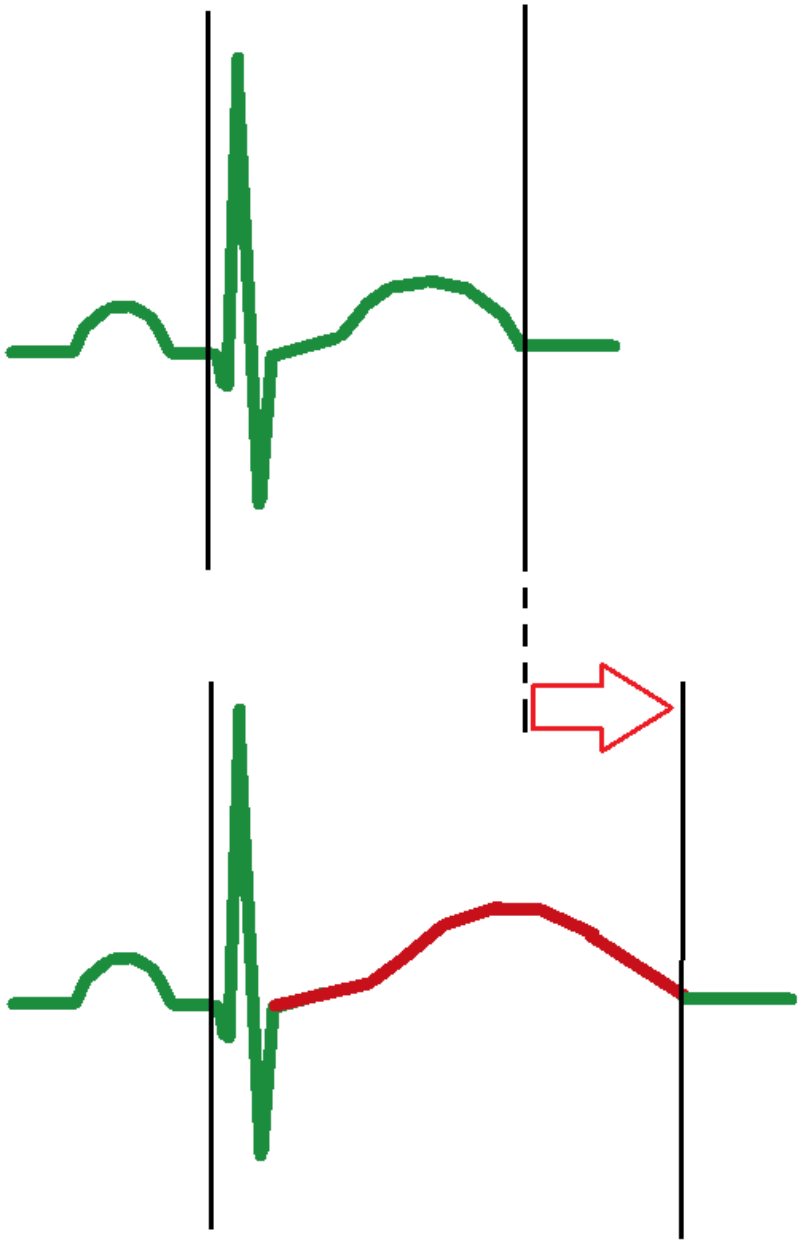
CARDIAC ANATOMY and PHYSIOLOGY "101"

When ION CHANNELS are MALFORMED, the abnormal channel shape may DELAY the transfer of IONS . . . . .

. . . . this can DELAY REPOLARIZATION, which will show on the ECG as "QT Prolongation"



Normal
QT Interval

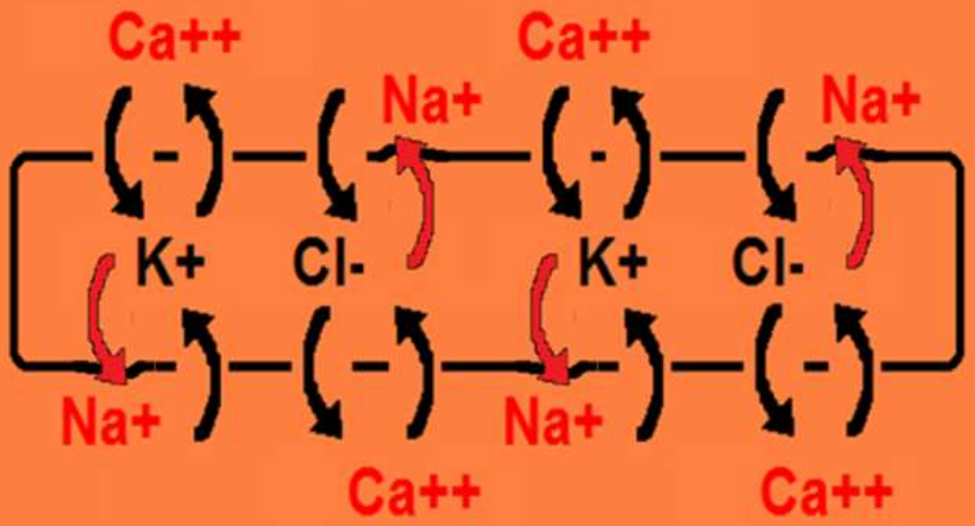


ABNORMAL
(prolonged)
QT Interval

CARDIAC ANATOMY and PHYSIOLOGY "101"

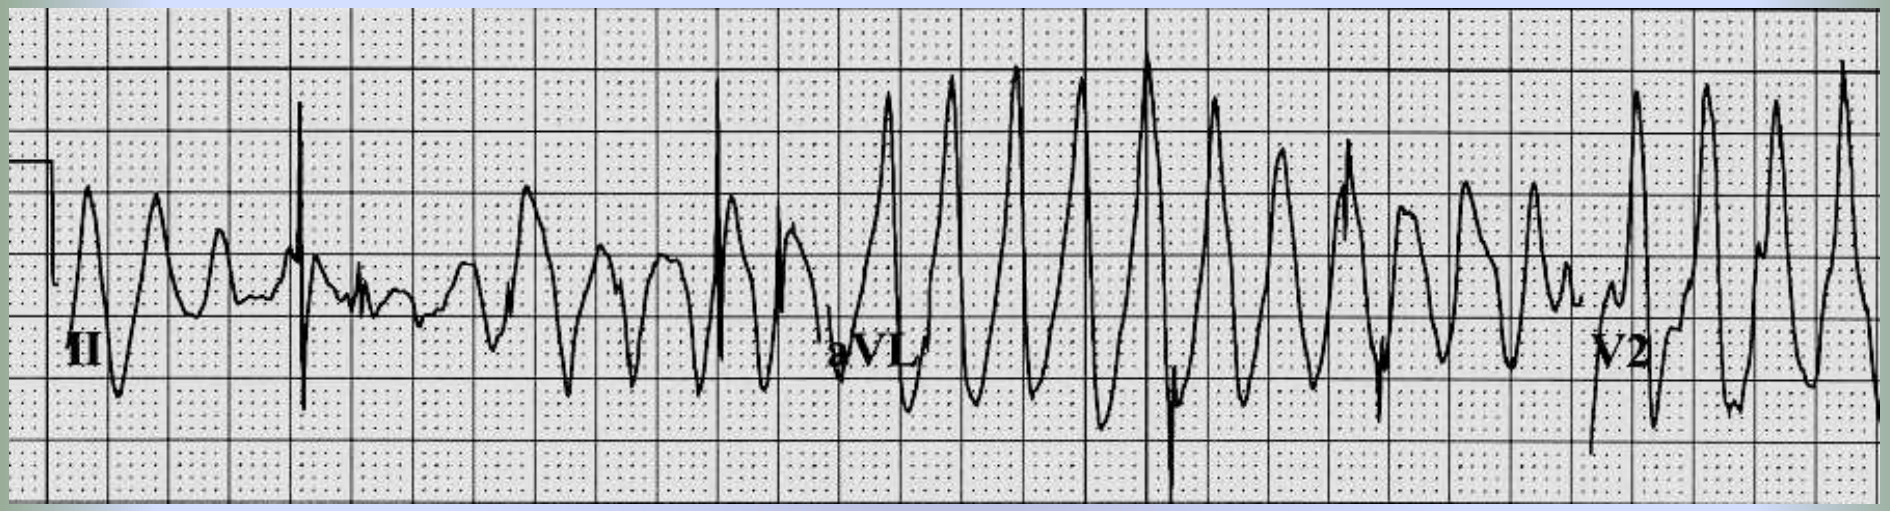
When ION CHANNELS are MALFORMED, the abnormal channel shape may DELAY the transfer of IONS . . . . .

. . . . this can DELAY REPOLARIZATION, which will show on the ECG as "QT Prolongation"



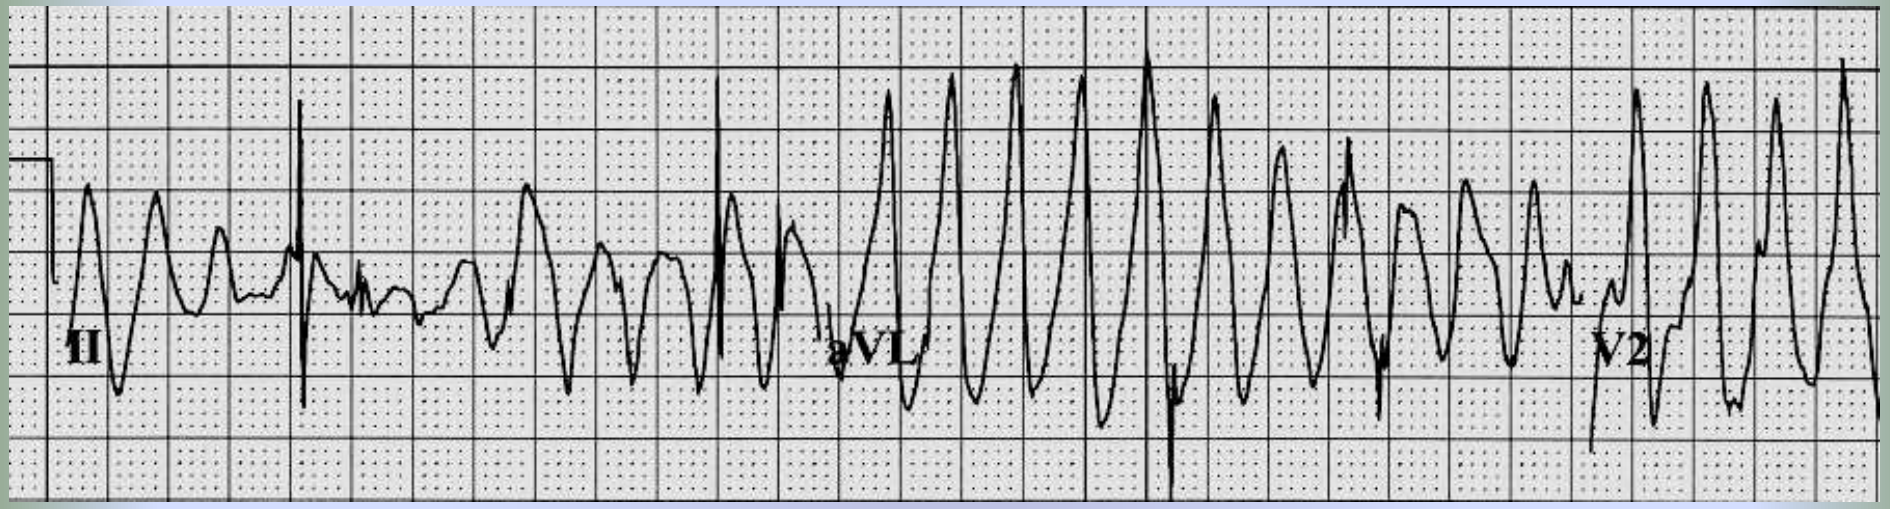
which can lead to Torsades . . . Cardiac Arrest . . . and *SUDDEN DEATH.*

Torsades de Pointes (TdP)



- **Common cause: QTc > 600 ms**
- Patients typically have little to no cardiac output when in this rhythm
- TdP may self-terminate or deteriorate into **VENTRICULAR FIBRILLATION**

Torsades de Pointes (TdP)



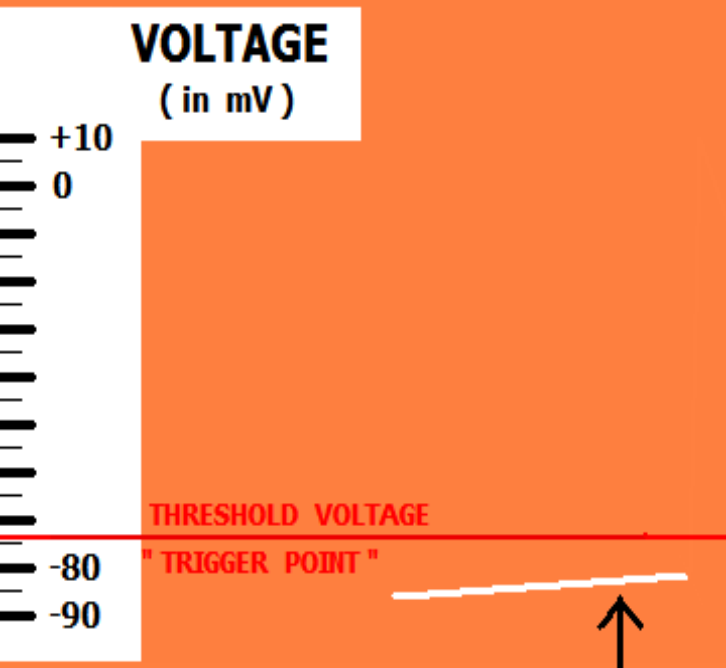
- Common cause: QTc > 600 ms
- Patients typically have little to no cardiac output when in this rhythm
- TdP may self-terminate or deteriorate into **VENTRICULAR FIBRILLATION**

Pacemaker Cells

- When cardiac cells **self-depolarize**

CARDIAC ANATOMY and PHYSIOLOGY "101"

VENTRICULAR MUSCLE CELL ACTION POTENTIAL



DURING PHASE 4, CELLS " LEAK OUT " SOME OF THEIR NEGATIVELY CHARGED IONS, CAUSING THE INSIDE OF THE CELL TO HAVE A LESS-NEGATIVE CHARGE . . .

CARDIAC ANATOMY and PHYSIOLOGY "101"

VENTRICULAR MUSCLE CELL ACTION POTENTIAL

PHASE:

4

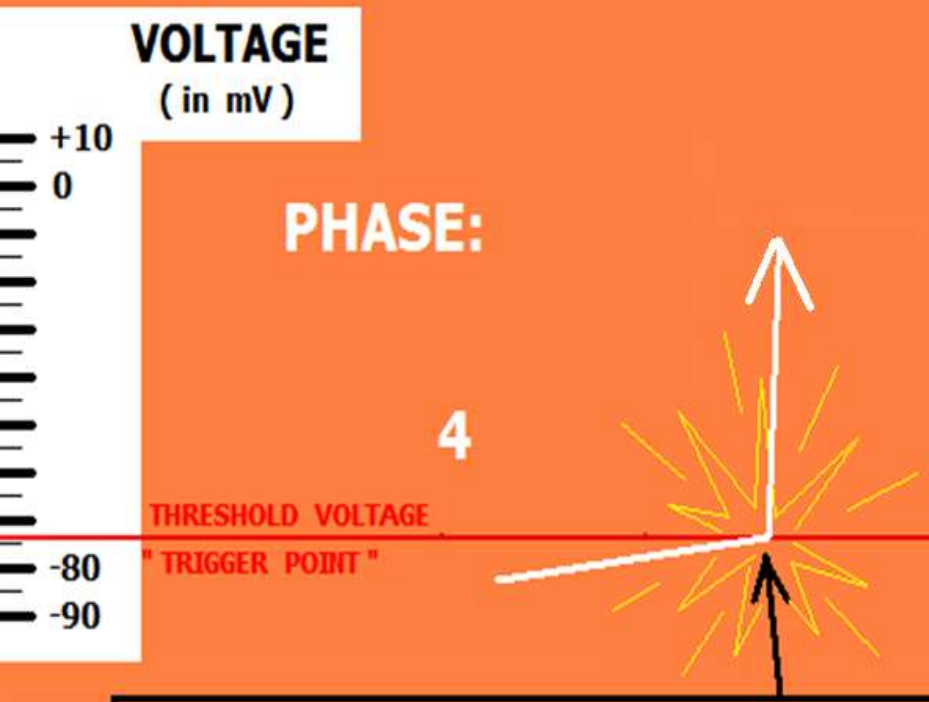
THRESHOLD VOLTAGE
" TRIGGER POINT "

ONE OF TWO EVENTS WILL CAUSE THE CELL TO DEPOLARIZE:

2. THE CELL WILL " LEAK " ENOUGH OF IT'S OWN IONS TO CAUSE IT TO REACH THE **THRESHOLD VOLTAGE**, (a.k.a the " **TRIGGER POINT** ")

CARDIAC ANATOMY and PHYSIOLOGY "101"

VENTRICULAR MUSCLE CELL ACTION POTENTIAL



THIS IS KNOWN AS ***AUTOMATICITY***

ONE OF TWO EVENTS WILL CAUSE THE CELL TO DEPOLARIZE:

2. THE CELL WILL " LEAK " ENOUGH OF IT'S OWN IONS TO CAUSE IT TO REACH THE THRESHOLD VOLTAGE, (a.k.a the " TRIGGER POINT ") CAUSING THE CELL TO DEPOLARIZE ITSELF . . . and then in turn, it's neighbors

SCOTT DAVIDSON, RN auscultating heart sounds at St. Joseph's Hospital Heart Institute Tampa, FL

HEART SOUNDS ASSESSMENT

HEART SOUNDS ARE GENERATED BY THE SOUND OF THE HEART VALVES CLOSING.

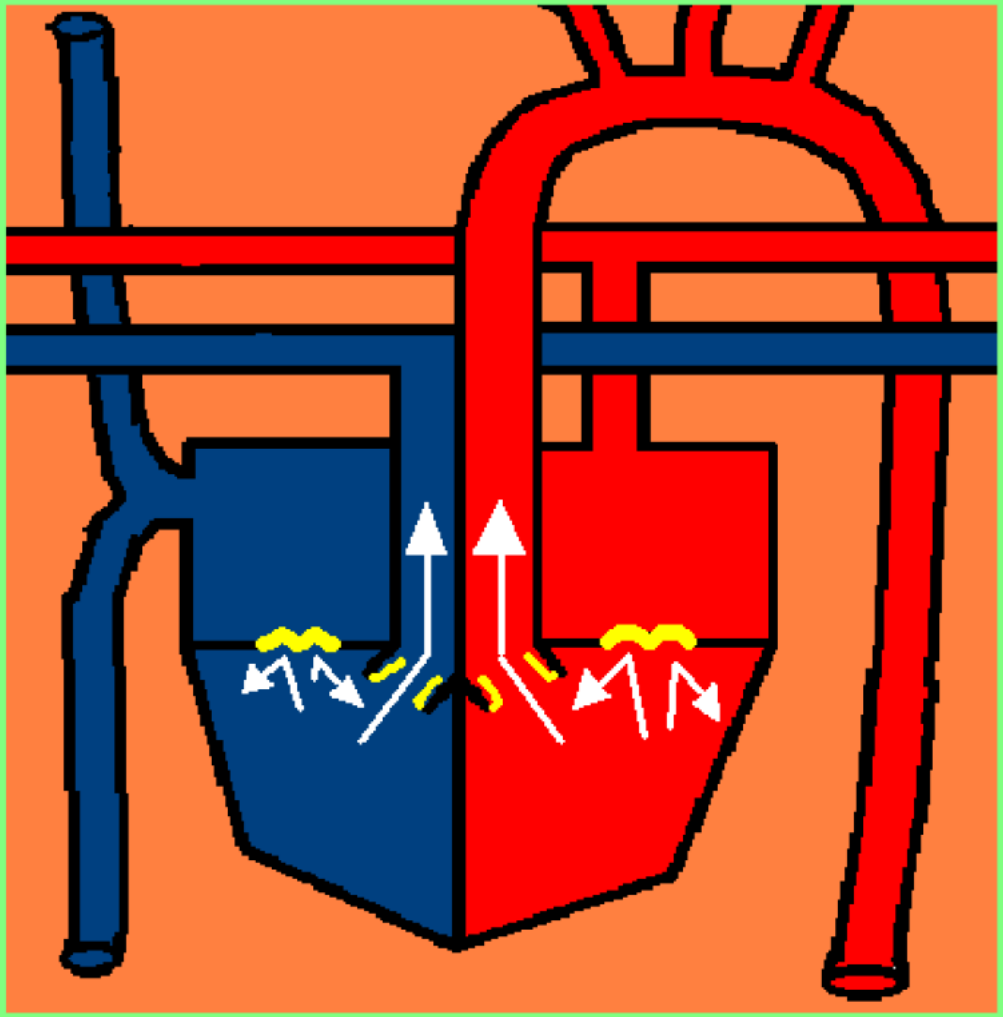
THERE ARE TWO NORMAL HEART SOUNDS, KNOWN AS: S-1 and S-2

WE OFTEN DESCRIBE THESE HEART SOUNDS AS "LUB - DUP"

HEART SOUNDS ASSESSMENT

S-1 BEGINNING OF SYSTOLE.

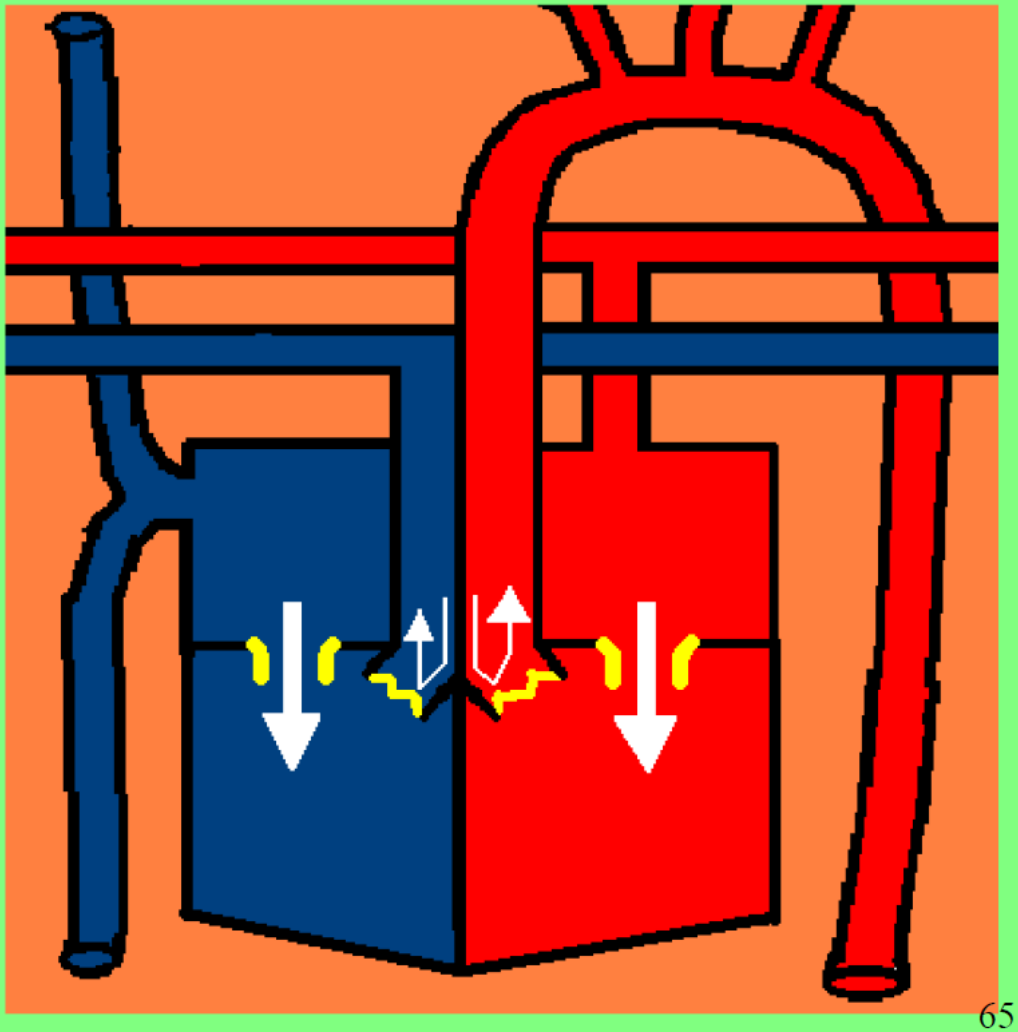
SOUND OF THE MITRAL AND TRICUSPID VALVES CLOSING.



HEART SOUNDS ASSESSMENT

S-2 OCCURS AT THE END OF SYSTOLE (THE BEGINNING OF DIASTOLE).

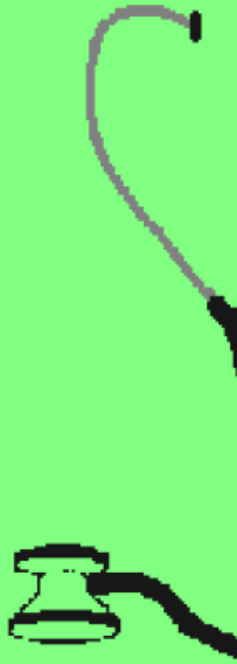
IT IS THE SOUND OF THE AORTIC AND PULMONARY VALVES CLOSING.



MURMUR = "SWOOSH"
SOUND CAUSED BY THE
SOUND OF TURBULENCE.

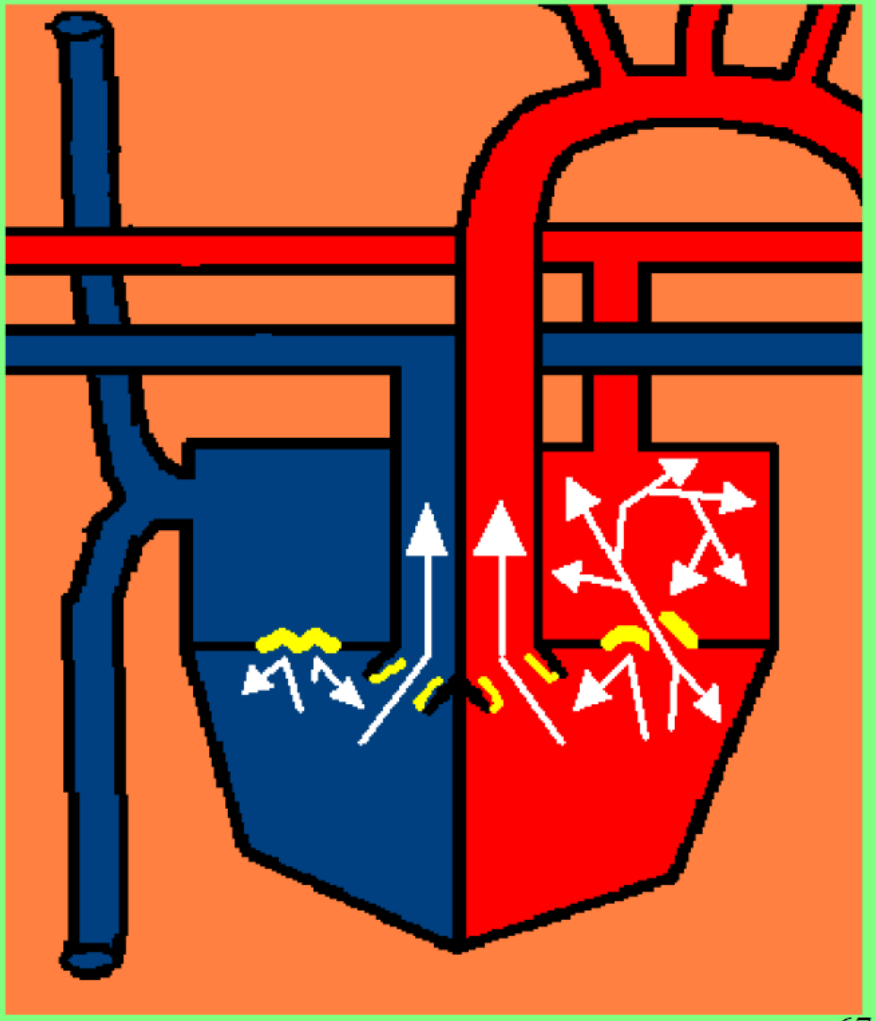
S-1 MURMUR SOUNDS LIKE:

"SWOOSH-DUB . . . . SWOOSH-
DUB . . . . SWOOSH-DUB . . . .
SWOOSH-DUB . . . "



CAUSE OF SYSTOLIC (S 1) MURMUR

- **DAMAGE TO MITRAL and/or TRICUSPID VALVE(s)**
- **CAUSES REGURGITATION**



- **MOST SYSTOLIC MURMURS CAUSED BY MITRAL VALVE FAILURE.**

- **ACUTE MITRAL VALVE REGURGITATION IS A POTENTIALLY LETHAL COMPLICATION OF ACUTE / RECENT EXTENSIVE TRANSMURAL MI**

ACUTE MITRAL VALVE RUPTURE USUALLY OCCURS 7-10 DAYS POST EXTENSIVE MI (e.g.: INFERIOR POSTERIOR LATERAL MI).

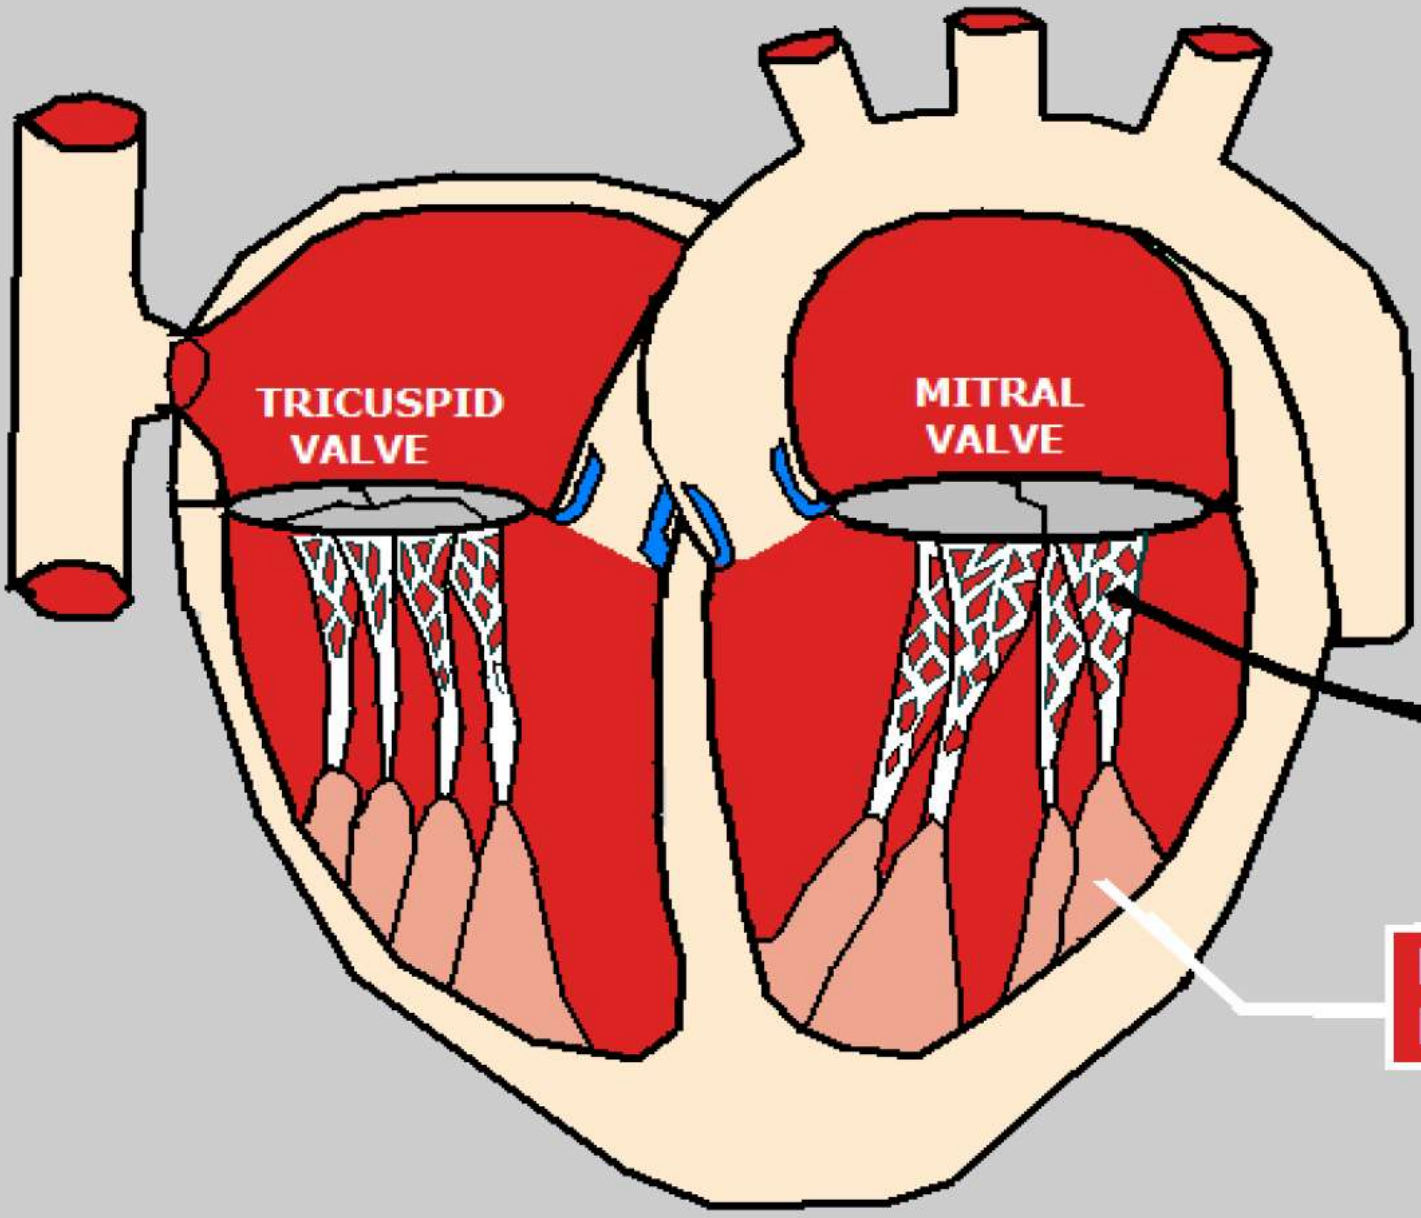
ACUTE Mitral Valve REGURGITATION can be caused by EXTENSIVE "Multi-Site" Myocardial Infarction and Necrosis – which results in PAPILLARY MUSCLE NECROSIS and PAPILLARY MUSCLE TEAR.

Papillary muscles are attached to "multiple surfaces" . . . . .

A Common Cause of ACUTE MITRAL REGURGITATION is:

"Patients who are 7-10 days POST-EXTENSIVE MI," in cases where the "zone of infarction" is large (e.g. "inferior-posterior-lateral") and there was a delay in PCI resulting in large zone of necrosis.

ATRIO-VENTRICULAR VALVES



ARE SECURED TO THE ENDO-CARDIAL SURFACE BY THE

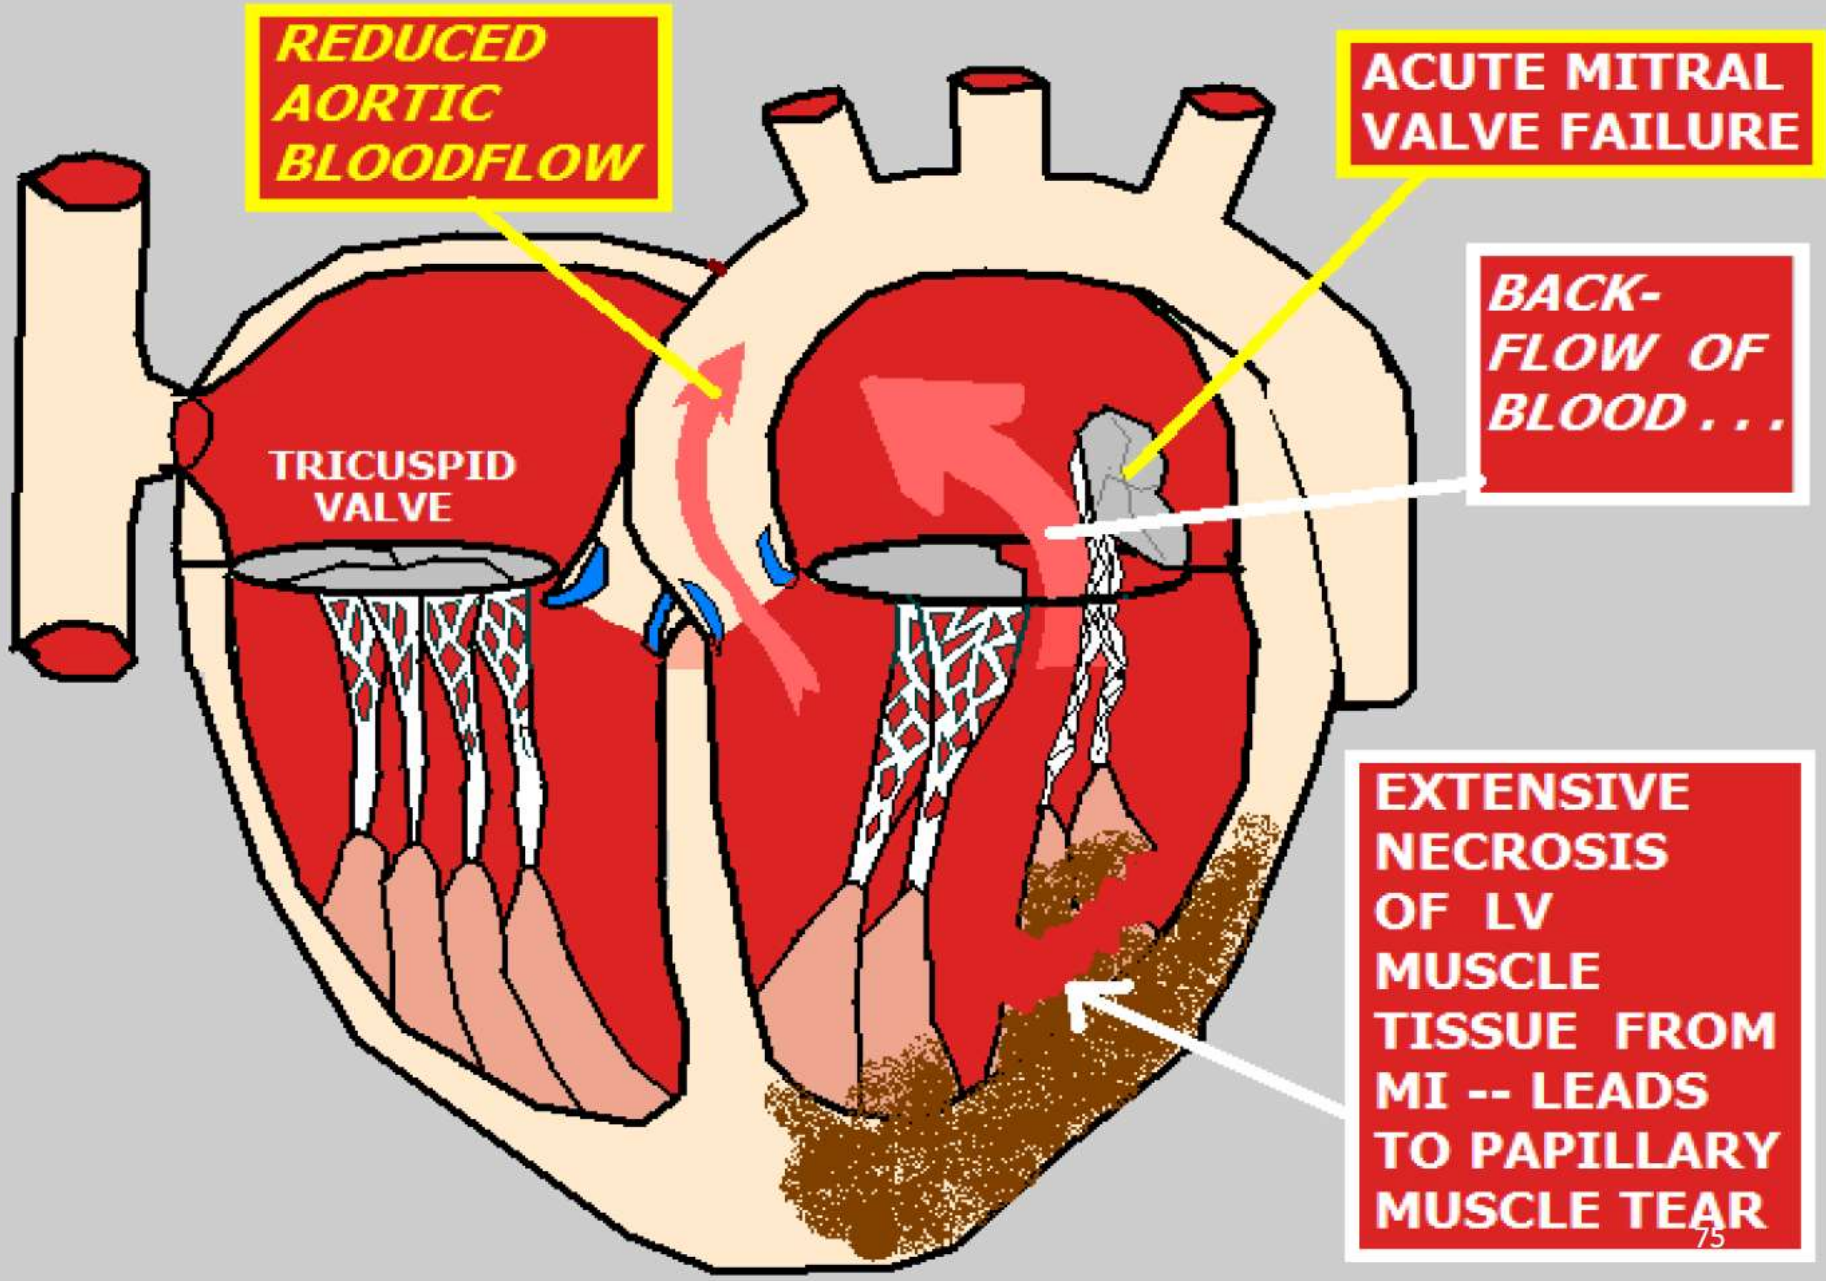
CHORDAE TENDINEAE

AND THE

PAPILLARY MUSCLES

ACUTE MITRAL REGURGITATION

DURING VENTRICULAR SYSTOLE



Symptoms of Acute Mitral Regurgitation

- SHOCK
- PROFOUND HYPOTENSION
- PINK, FROTHY SPUTUM
- PULMONARY EDEMA
- SYSTOLIC (S1) MURMUR

"SWOOSH – DUB……SWOOSH – DUB……SWOOSH – DUB…"

BASIC HEART SOUNDS ASSESSMENT

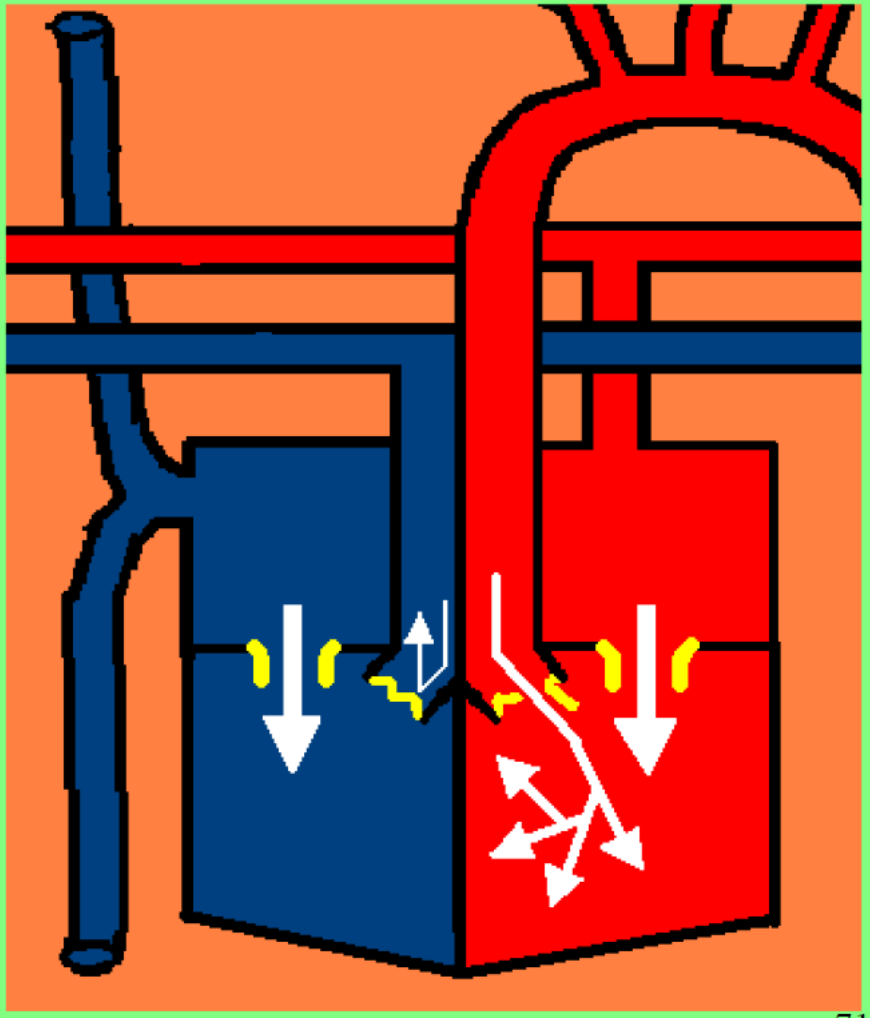
**MURMUR = "SWOOSH"
SOUND CAUSED BY THE
SOUND OF TURBULENCE.**

S-2 MURMUR SOUNDS LIKE:

**"LUB-SWOOSH . . . . LUB-SWOOSH
. . . .LUB-SWOOSH . . . . LUB-
SWOOSH . . . "**

CAUSE OF DIASTOLIC (S2) MURMUR

- **DAMAGE TO AORTIC and/or PULMONIC VALVE(s)**
- **CAUSES REGURGITATION**



Chronic **Valvular REGURGITATION** (Leaky Valve) leads to elevated heart chamber pressures and DILITATION.

Chronic **Valvular STENOSIS** (“Creaky” Valve) leads to Cardiac Muscle STRAIN and HYPERTROPHY.

BOTH conditions, if untreated, eventually leads to **HEART FAILURE.**

Heart Sounds: S3

- S3 sounds like: " kenTUCky . . . kenTUCky"
- Caused by: increased atrial pressure.
- S3 is associated with: **Heart Failure, Dilated Cardiomyopathy.**

Heart Sounds: S4

- S4 sounds like: "TENnessee. . . TENnessee"
- Caused by: stiffened left ventricle.
- S4 is associated with: **Hypertension, Aortic Stenosis, Ischemic** or **Hypertrophic Cardiomyopathy.**

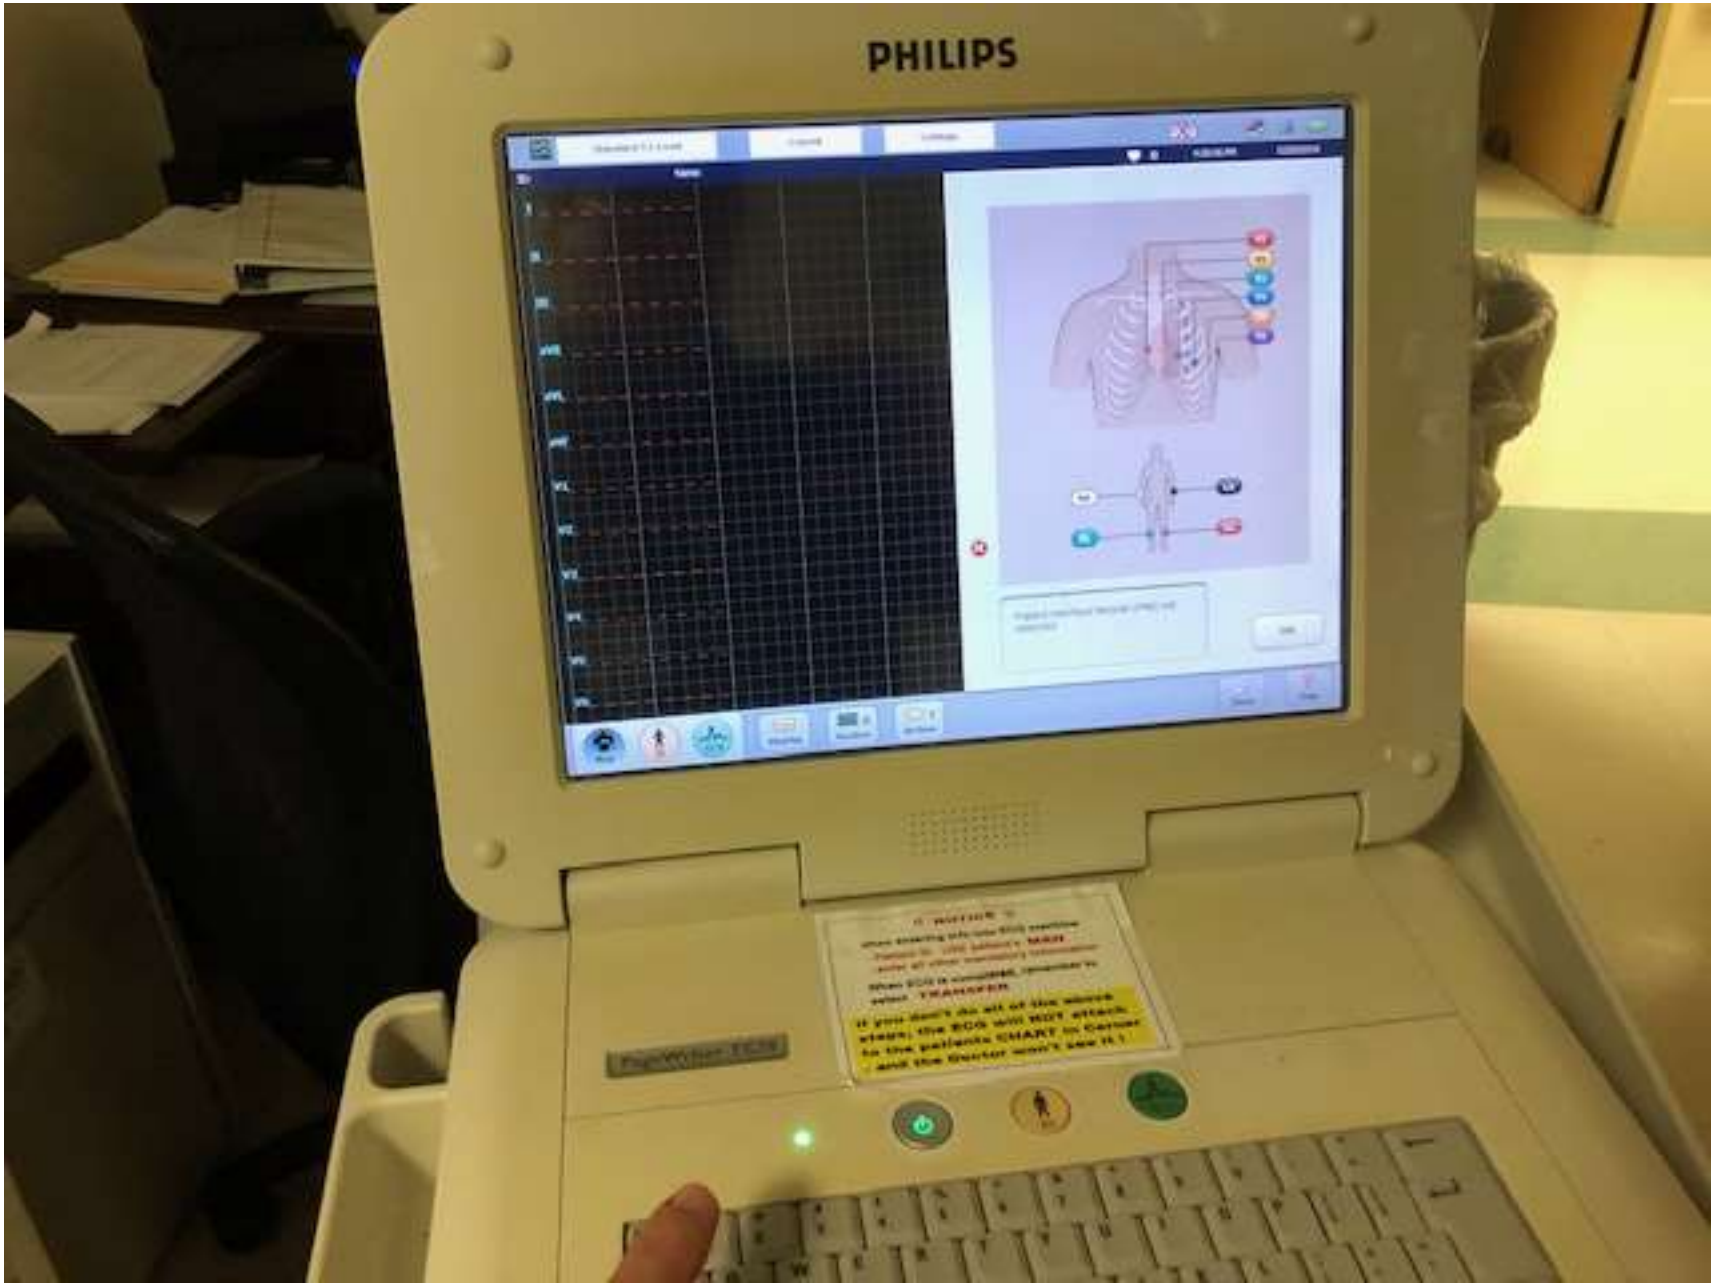
- 6 chest (“V”) leads

Sanitas



PHILIPS

OBTAINING
THE
12 LEAD ECG

And have it interpreted by a physician or mid-level provider
…within 10 minutes !

Obtaining the 12 Lead ECG

- **Limb leads should be on the limbs.**

Obtaining the 12 Lead ECG

- **Limb leads should be on the limbs.**
- **When emergency circumstances dictate that limb leads be placed on patient's torso, the words "LIMB LEADS ON PATIENT'S TORSO" should be noted on the ECG.**

Obtaining the 12 Lead ECG

Recent AHA/ACC/HRS literature indicates QRS AMPLITUDE, Q WAVE DURATION, AXIS and WAVEFORM DEFLECTION can be altered when limb leads are placed on the patient's torso (Mason-Likar lead placement).

Therefore every effort should be made to place limb leads on the limbs.

Recommendations for the Standardization and Interpretation of the Electrocardiogram

Part I: The Electrocardiogram and Its Technology

affected by monitoring lead placement; however, tracings that use torso electrodes differ in important ways from the standard 12-lead ECG. In addition to body position differences that affect the ECG,[109] monitoring electrodes placed on the trunk do not provide standard limb leads, and distortion of the central terminal alters the augmented limb leads and the precordial leads.[110,111] Tracings with Mason-Likar and other alternative lead placement may affect QRS morphology more than repolarization compared with the standard ECG; these differences can include false-negative and false-positive infarction criteria.[81,112] Motion artifact of the limbs is a particular problem for routine recording in neonates, infants, and

AHA/ACC/HRS Scientific Statement

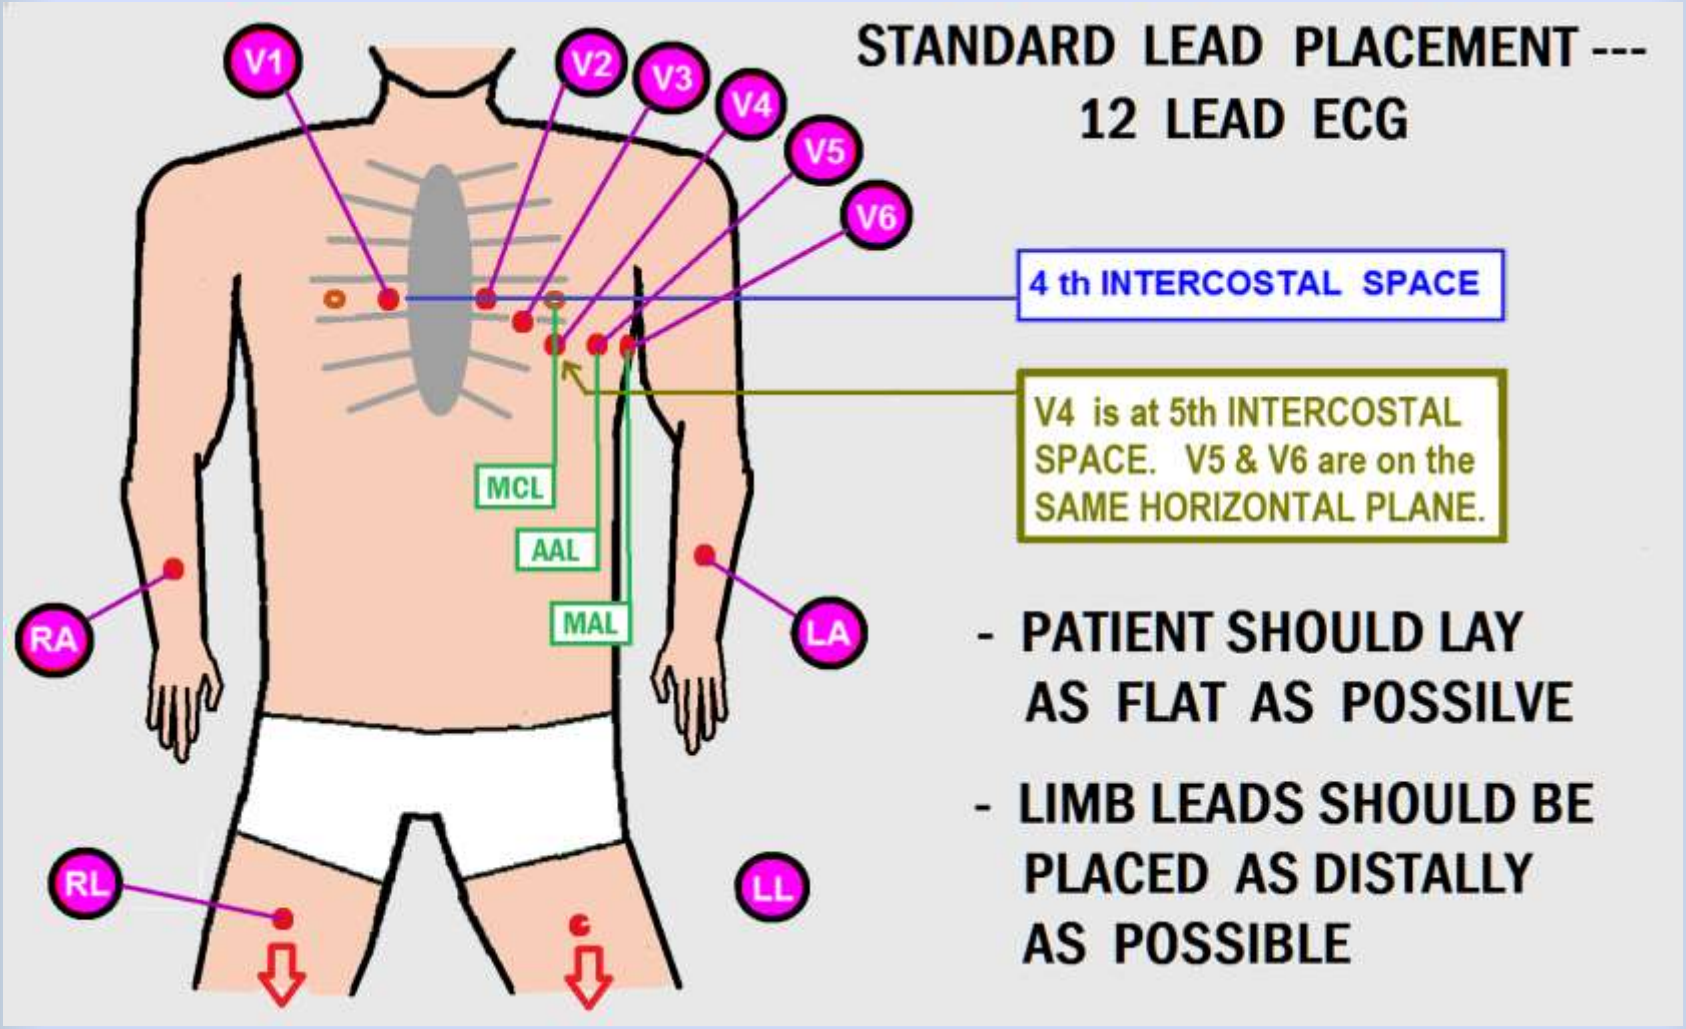
Recommendations for the Standardization and Interpretation of the Electrocardiogram

Part I: The Electrocardiogram and Its Technology

Recommendations

ECGs recorded with torso placement of the extremity electrodes cannot be considered equivalent to standard ECGs for all purposes and should not be used interchangeably with standard ECGs for serial comparison. Evaluation of the effect of torso placement of limb leads on waveform amplitudes and

Obtaining the 12 Lead ECG



Leads V1 & V2 on 12 Lead ECG:

- **Proper lead placement of precordial Leads V1 and V2 are 4th intercostal space on opposite sides of the sternum.**
- **Incorrect placement of Leads V1 and V2 will result in: reduction of R wave amplitude (resulting in poor R wave progression) leading to misdiagnosis of previous anterior / septal infarction.**

Part I: The Electrocardiogram and Its Technology

the often profound alterations in waveforms that can result from precordial electrode misplacement.[85,86] A common error is superior misplacement of V_1 and V_2 in the second or third intercostal space. This can result in reduction of initial R-wave amplitude in these leads, approximating 0.1 mV per interspace, which can cause poor R-wave progression or erroneous signs of anterior infarction.[87] Superior displacement of the V_1 and V_2 electrodes will often result in rSr′ complexes with T-wave inversion, resembling the complex in lead aVR. It also has been shown that in patients with low diaphragm position, as in obstructive pulmonary disease,[88,89]

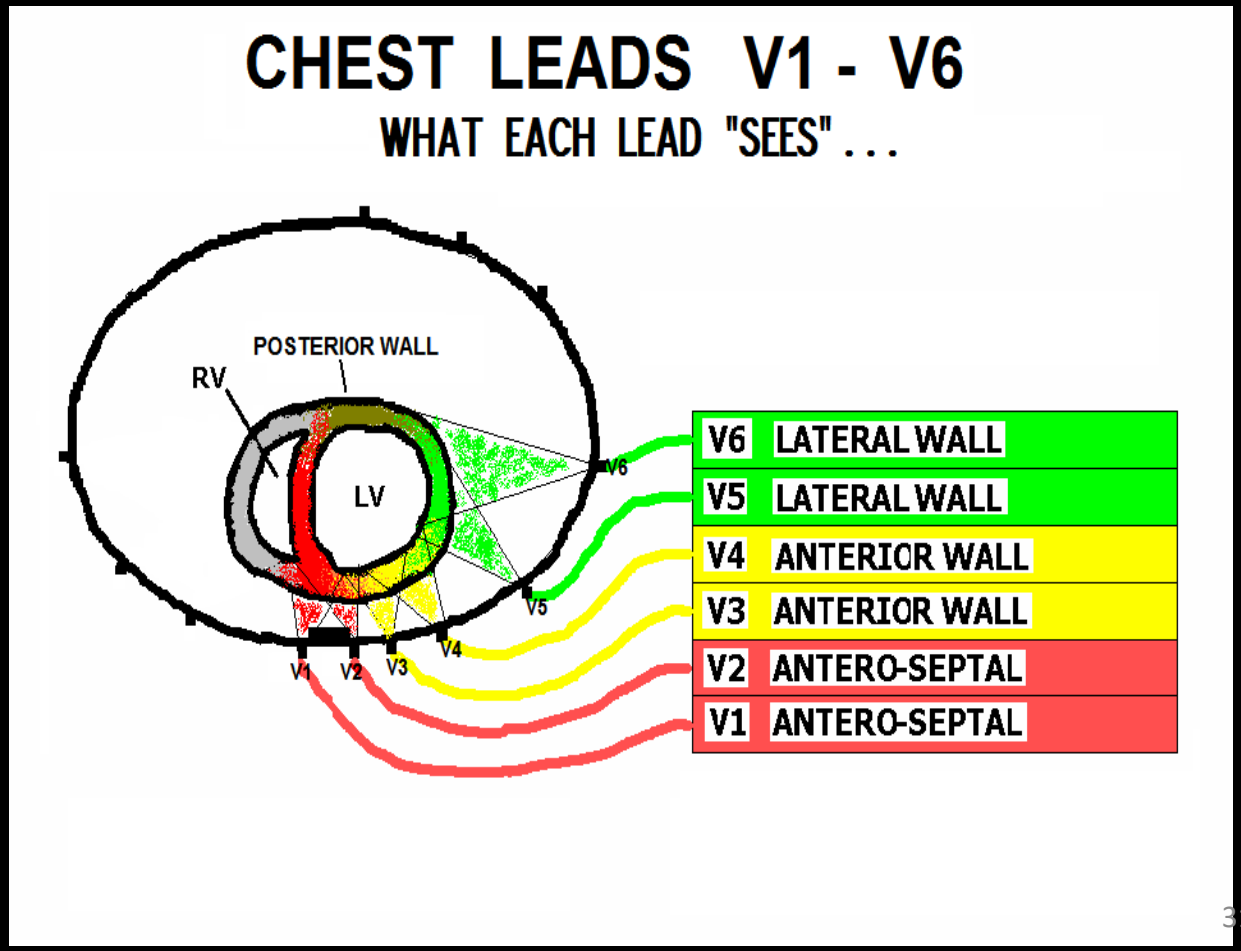
The 12 Lead ECG
Has TWO major BLIND SPOTS . . . . .

The POSTERIOR WALL

&

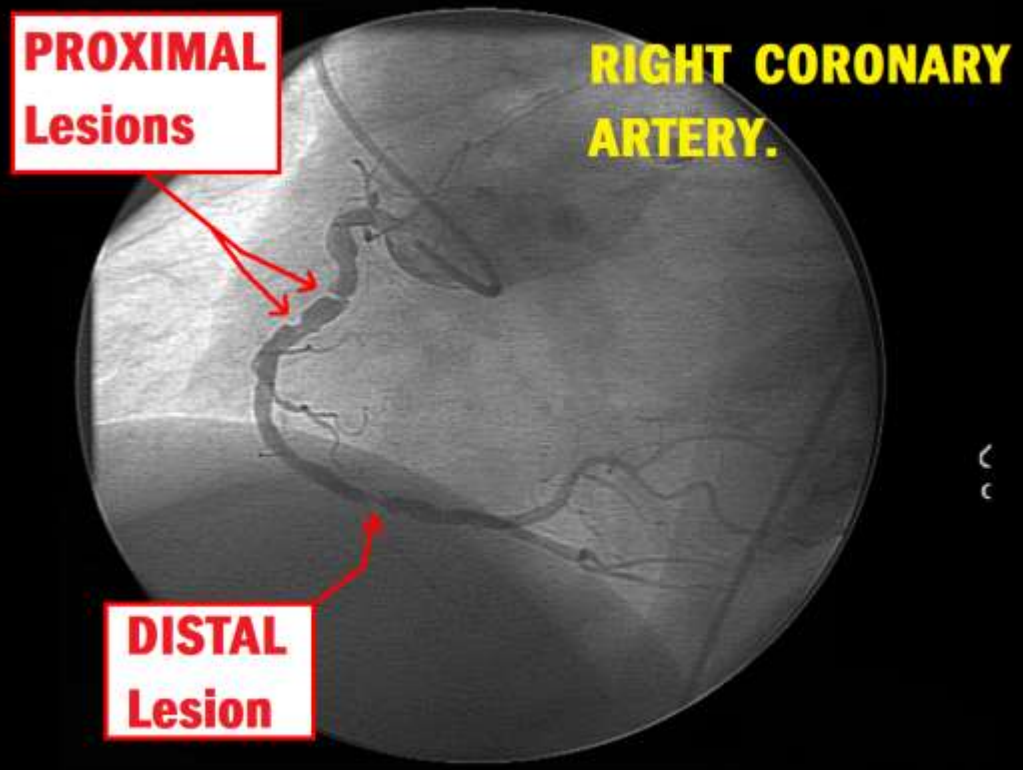
RIGHT VENTRICLE

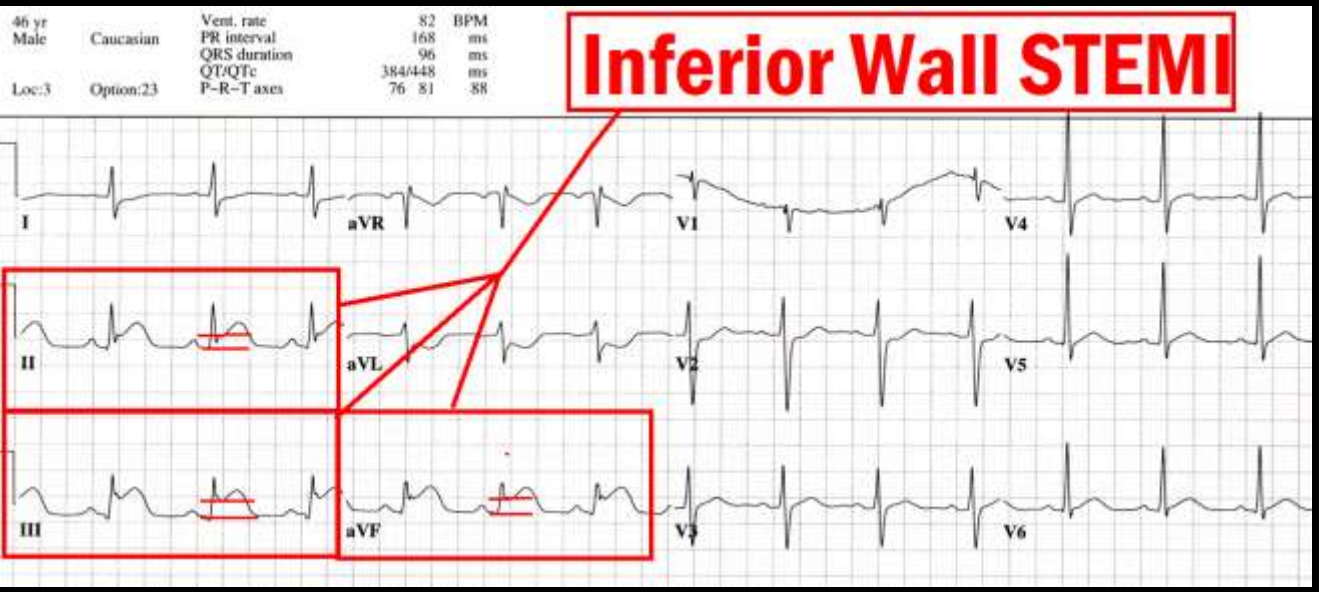


When do we need to see the Right Ventricle?

- All Patient with INFERIOR WALL STEMI (ST Elevation in Leads II, III, aVF).

When you see an EKG with **ST Elevation in Leads II, III and AVF** (Inferior Wall STEMI) – you cannot tell if the blockage is in the PROXIMAL RCA – or the DISTAL RCA.





To see the

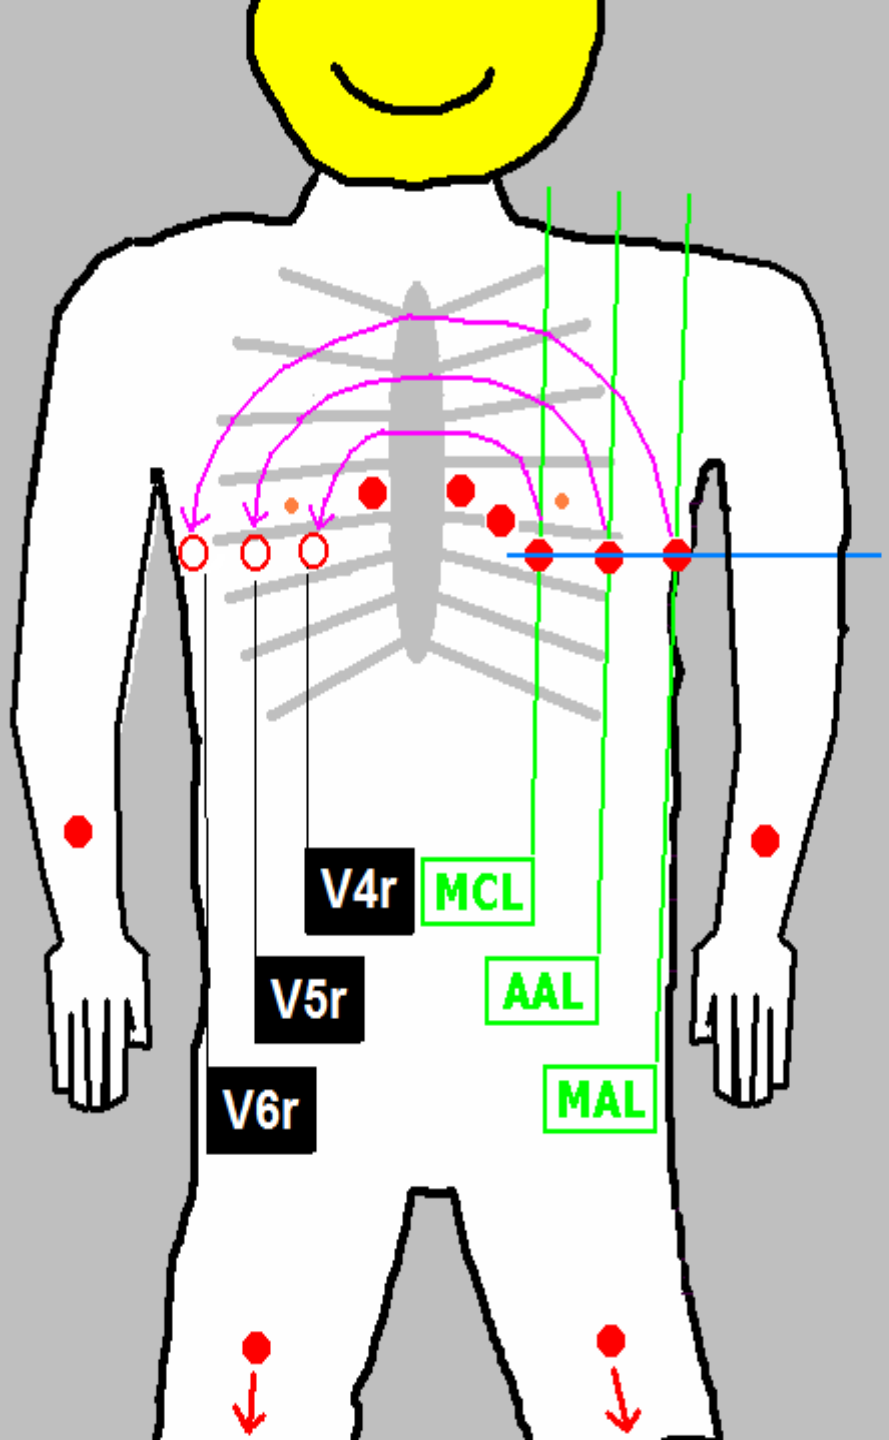
RIGHT VENTRICLE . . .

. . . such as in cases of

INFERIOR WALL M.I.

☞ You must do a

RIGHT - SIDED EKG ! !



To do a
RIGHT - SIDED EKG . .

MOVE leads
V4, V5, and V6

to the corresponding placement on the RIGHT SIDE of patient's chest . . .

When do we need to see the Posterior Wall?

- Any time a patient presents with symptoms of ACS and the 12 Lead ECG shows ST Depression in Leads V1, V2, V3 and/or V4.

Whenever you see

ST DEPRESSION in Leads V1 - V4

you must do a

POSTERIOR LEAD ECG

(V7 - V9)

to see if you Patient is having a

POSTERIOR WALL STEMI

Whenever your patient's ECG exhibits ST DEPRESSION in any of the ANTERIOR LEADS (V1-V4), CONSIDER the possibility of POSTERIOR WALL STEMI ! !

. . . To DIGANOSE Posterior Wall STEMI, we should see LEADS V7 – V9 !!

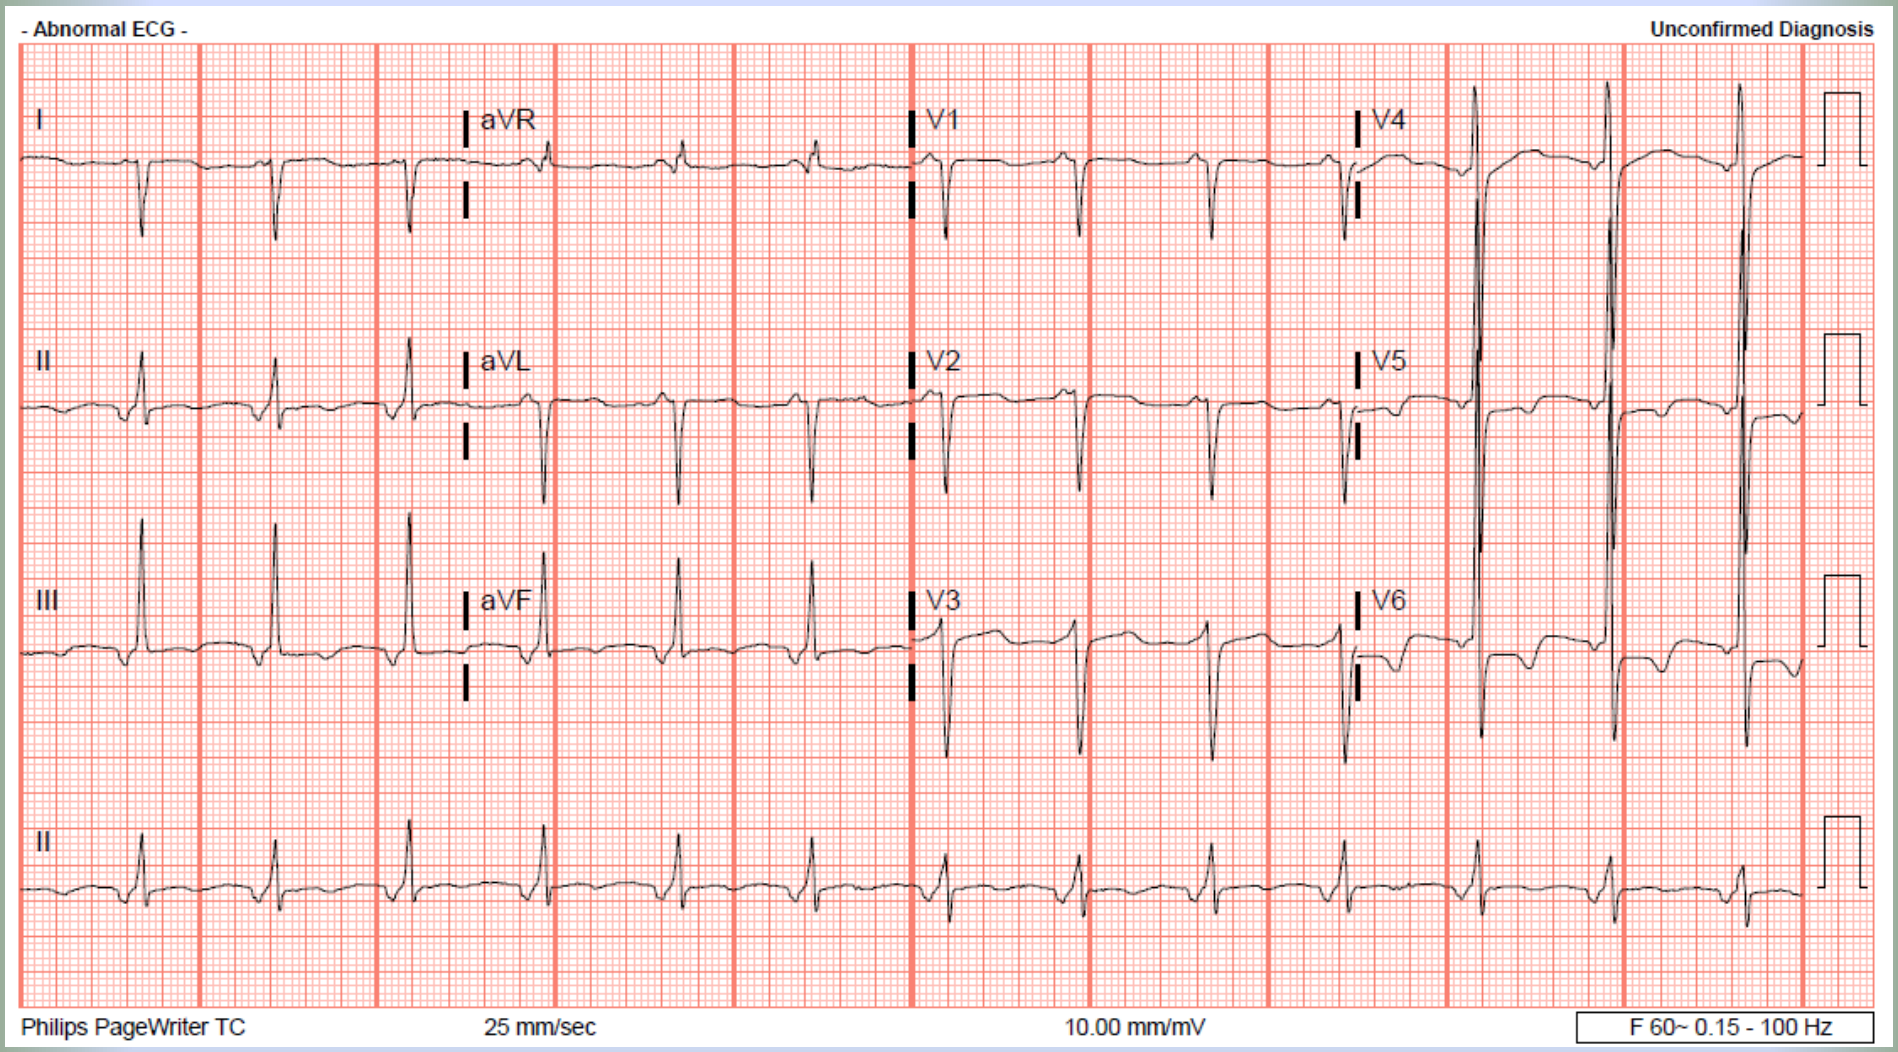
P Wave Axis

- P waves with abnormal axis (“not pointing in the right direction”) may signify ectopic atrial beats.
- When P waves are inverted in most leads with an abnormally short P-R interval (<120ms) the origin of the rhythm may be the AV node (Junctional Rhythm).

Inverted P waves & short P-R interval:

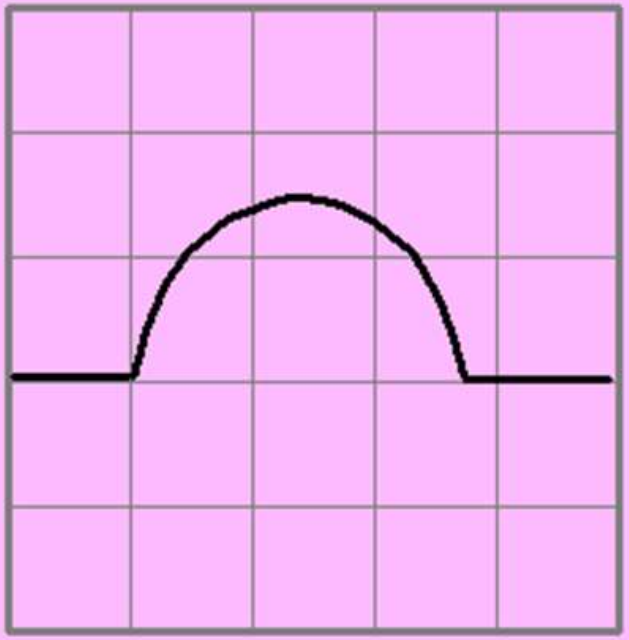


Evaluate P Wave for Atrial Hypertrophy

- Evaluate amplitude and duration in Lead II

THE P WAVE

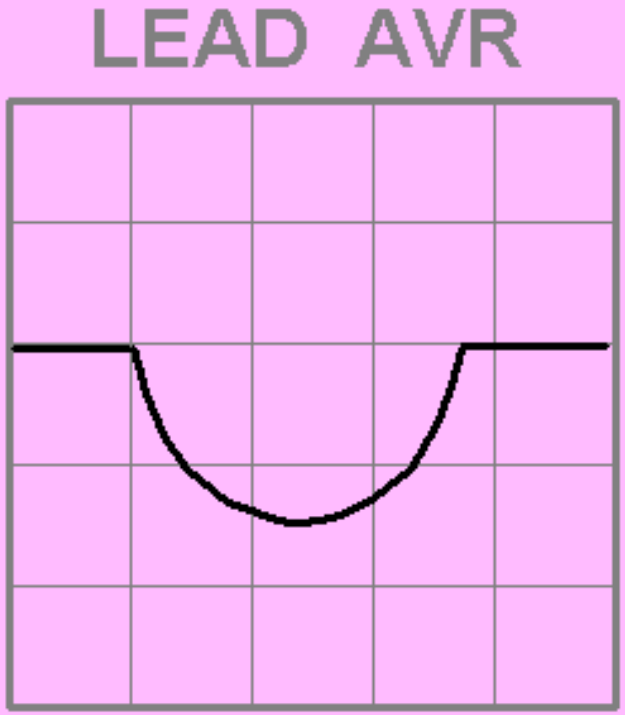
- SHOULD BE UPRIGHT, CONVEX-SHAPED DOME IN ALL LEADS EXCEPT AVR and V1



- SHOULD BE LESS THAN .2 mv (2 mm) HIGH
- SHOULD BE LESS THAN 100 ms (2.5mm) LONG

THE P WAVE

- SHOULD BE INVERTED IN LEAD AVR



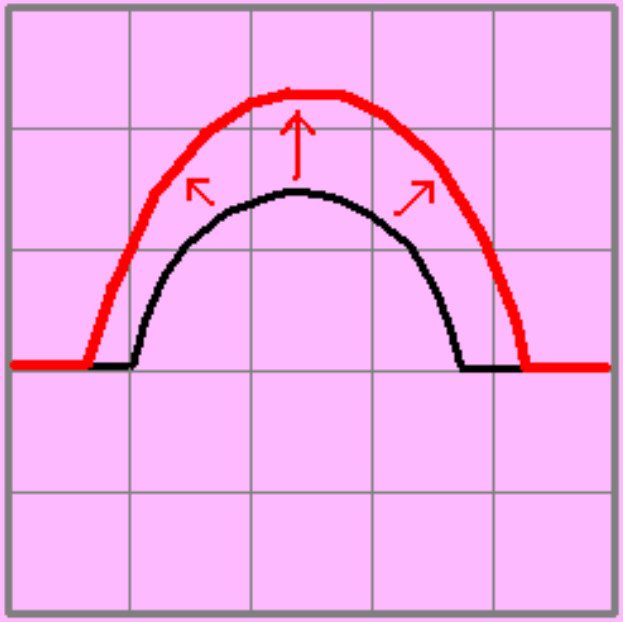
THE P WAVE

When the P WAVE

is

TOO LARGE

We think of



ATRIAL HYPERTROPHY

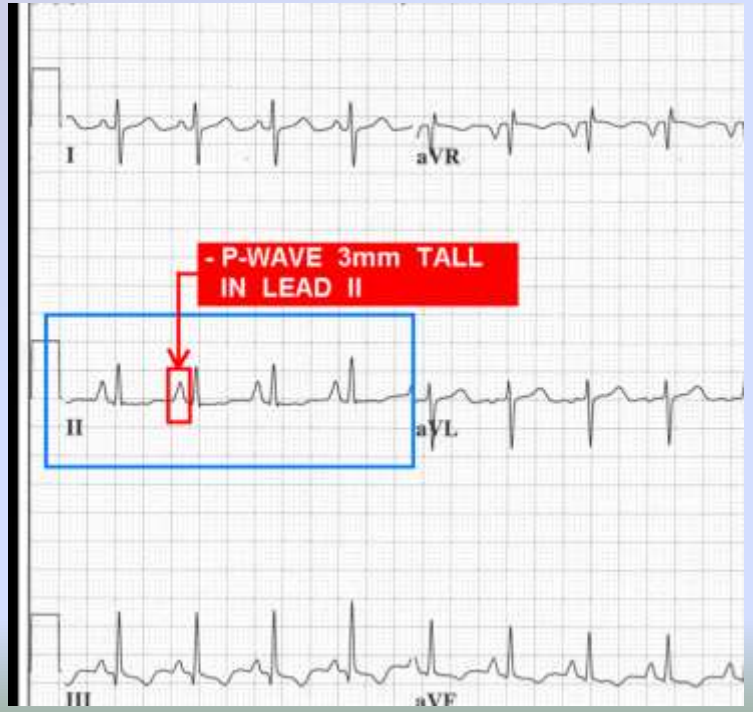
(SPECIFIC CRITERIA FOR ATRIAL HYPERTROPHY IS DISCUSSED IN MORE DETAIL IN THE "CHAMBER HYPERTROPHY" SECTION)

Evaluate P Wave for Atrial Hypertrophy

- Evaluate amplitude and duration in ***Lead II***

Evaluate P Wave for Atrial Hypertrophy

- Evaluate amplitude and duration in Lead II
- If the P wave it “too tall (>2mm) or too long (>2.5mm)” in Lead II, ***then go to Lead V1*** to evaluate P wave . . . .



THE P WAVE

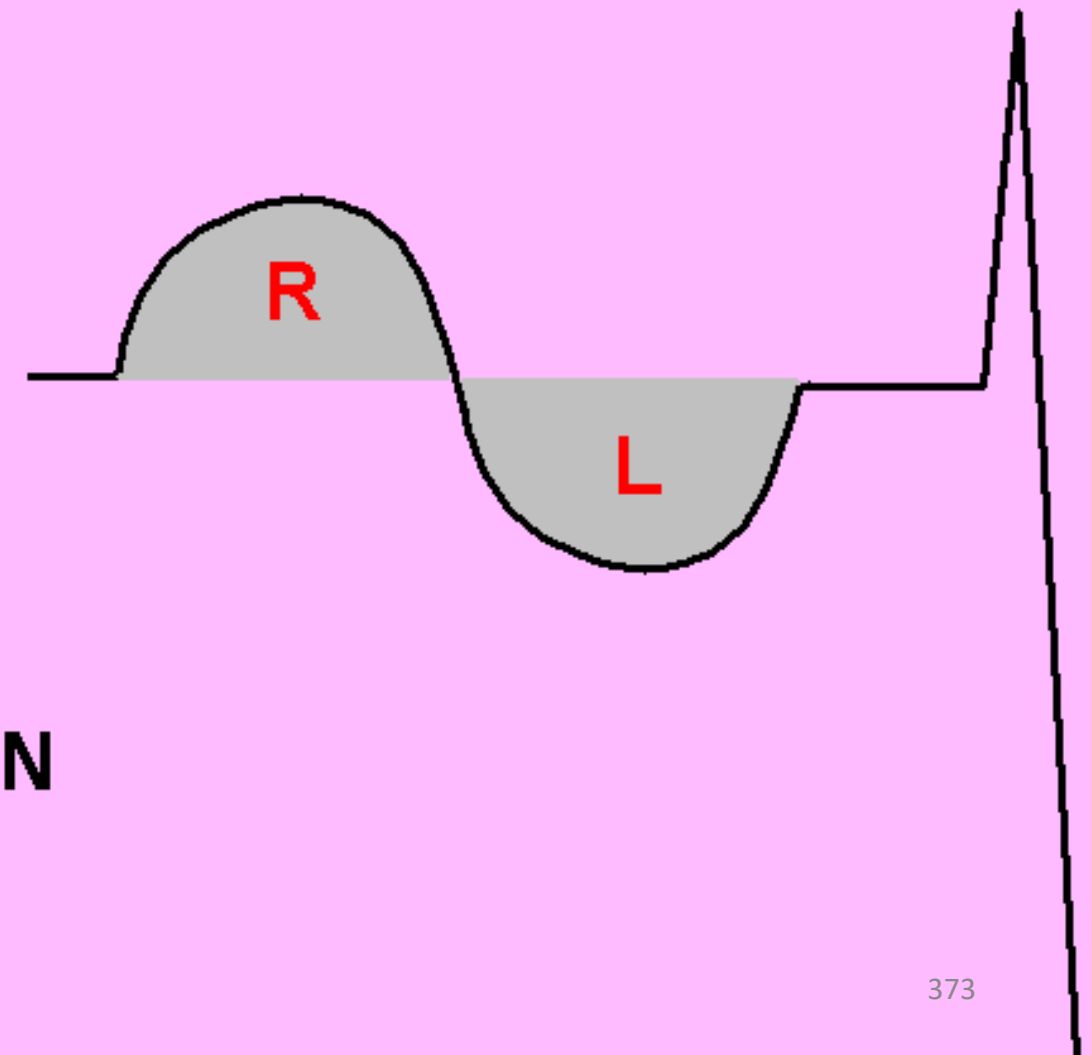
IN LEAD V1 MAY BE:

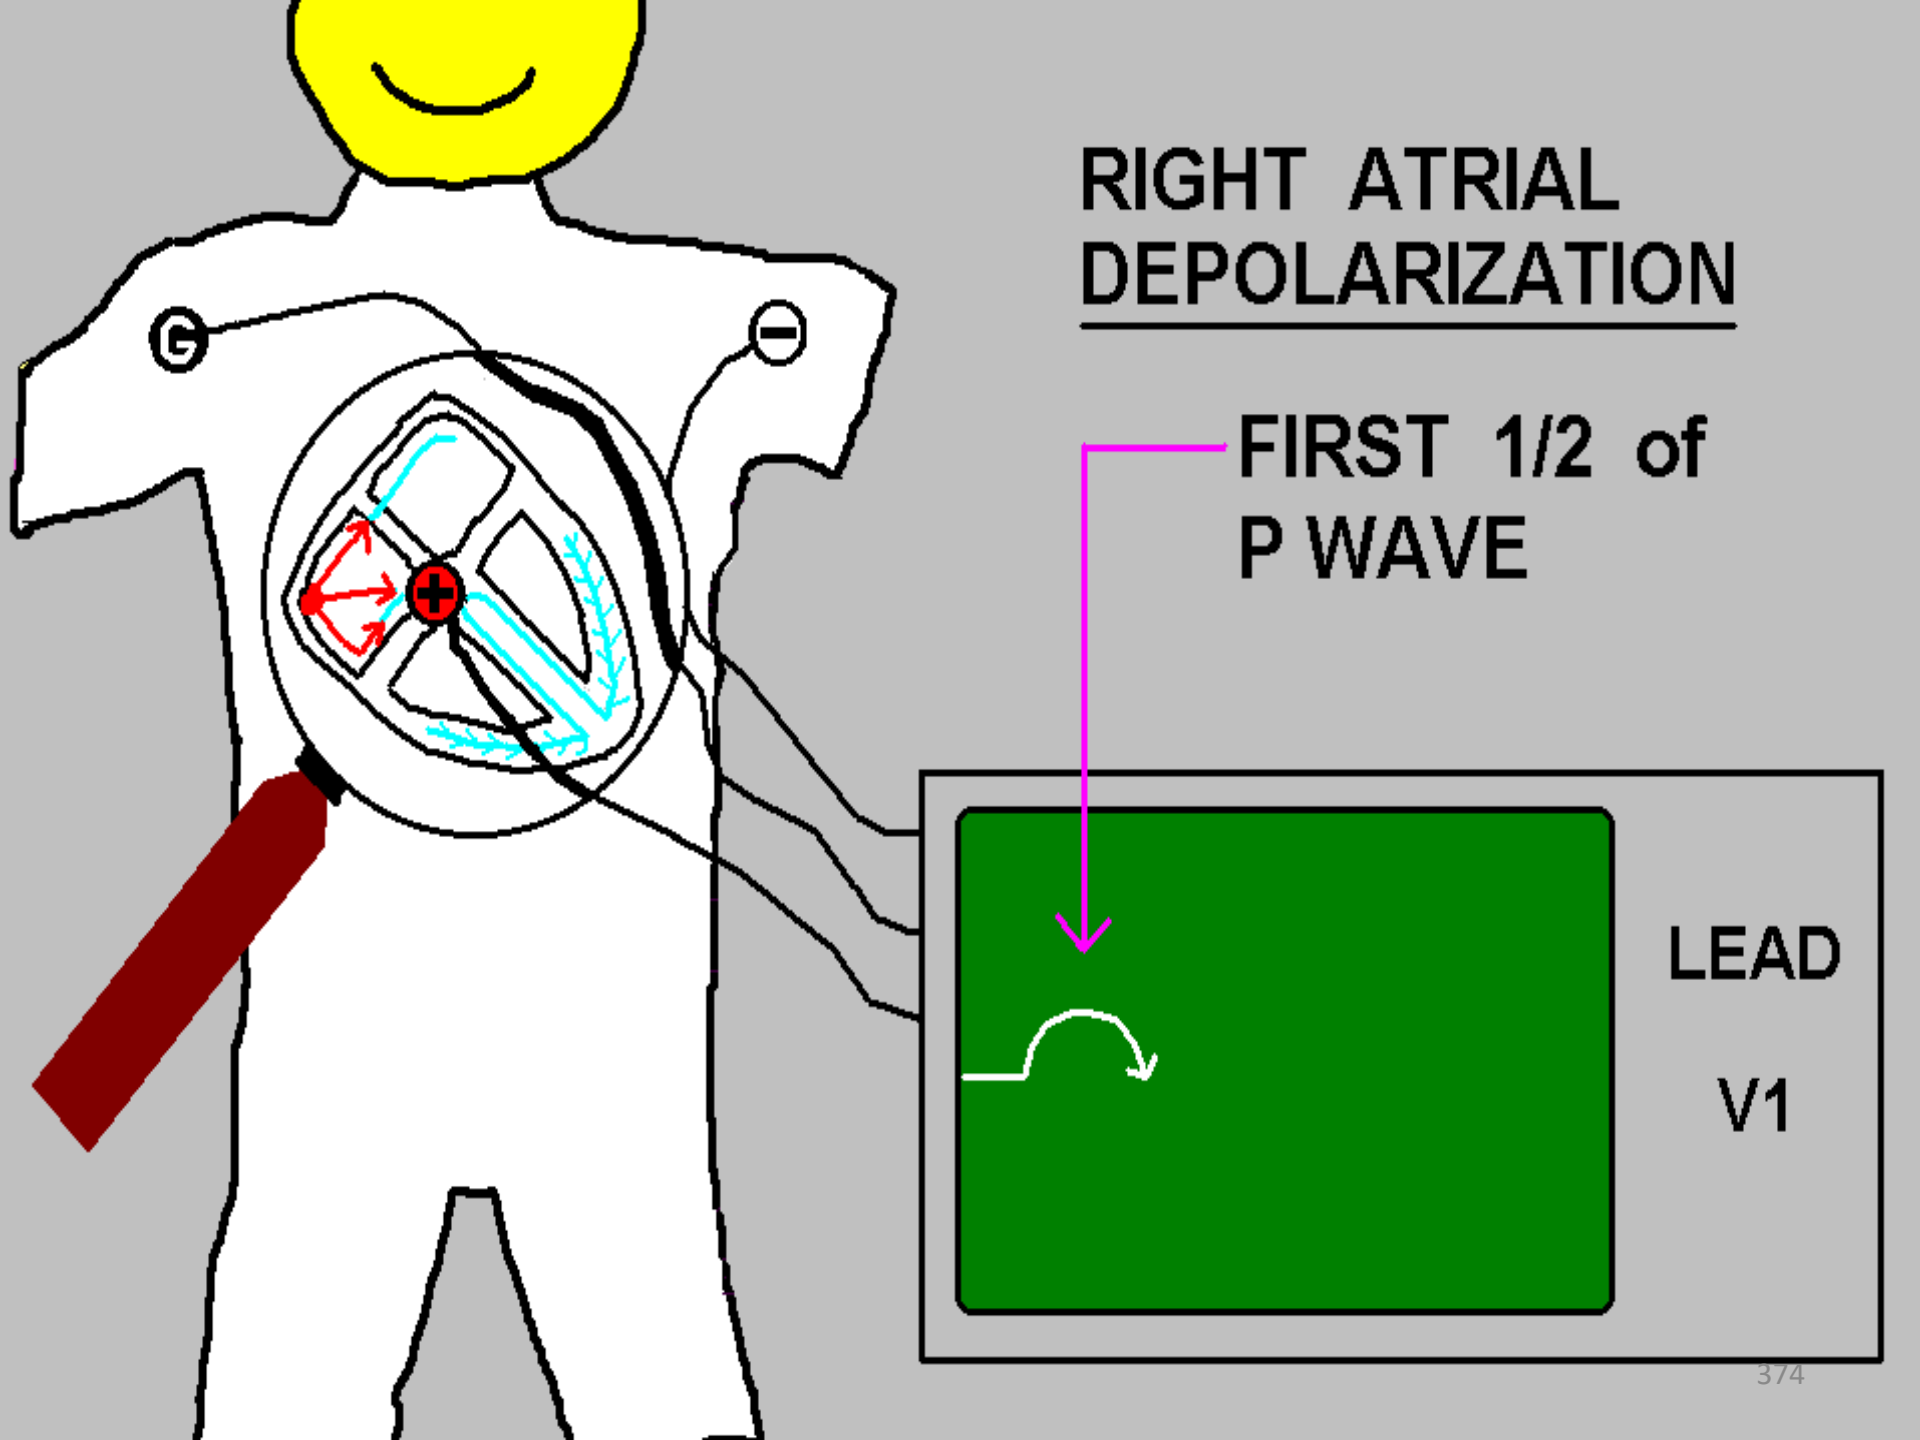
- POSITIVE

- OR BI-PHASIC

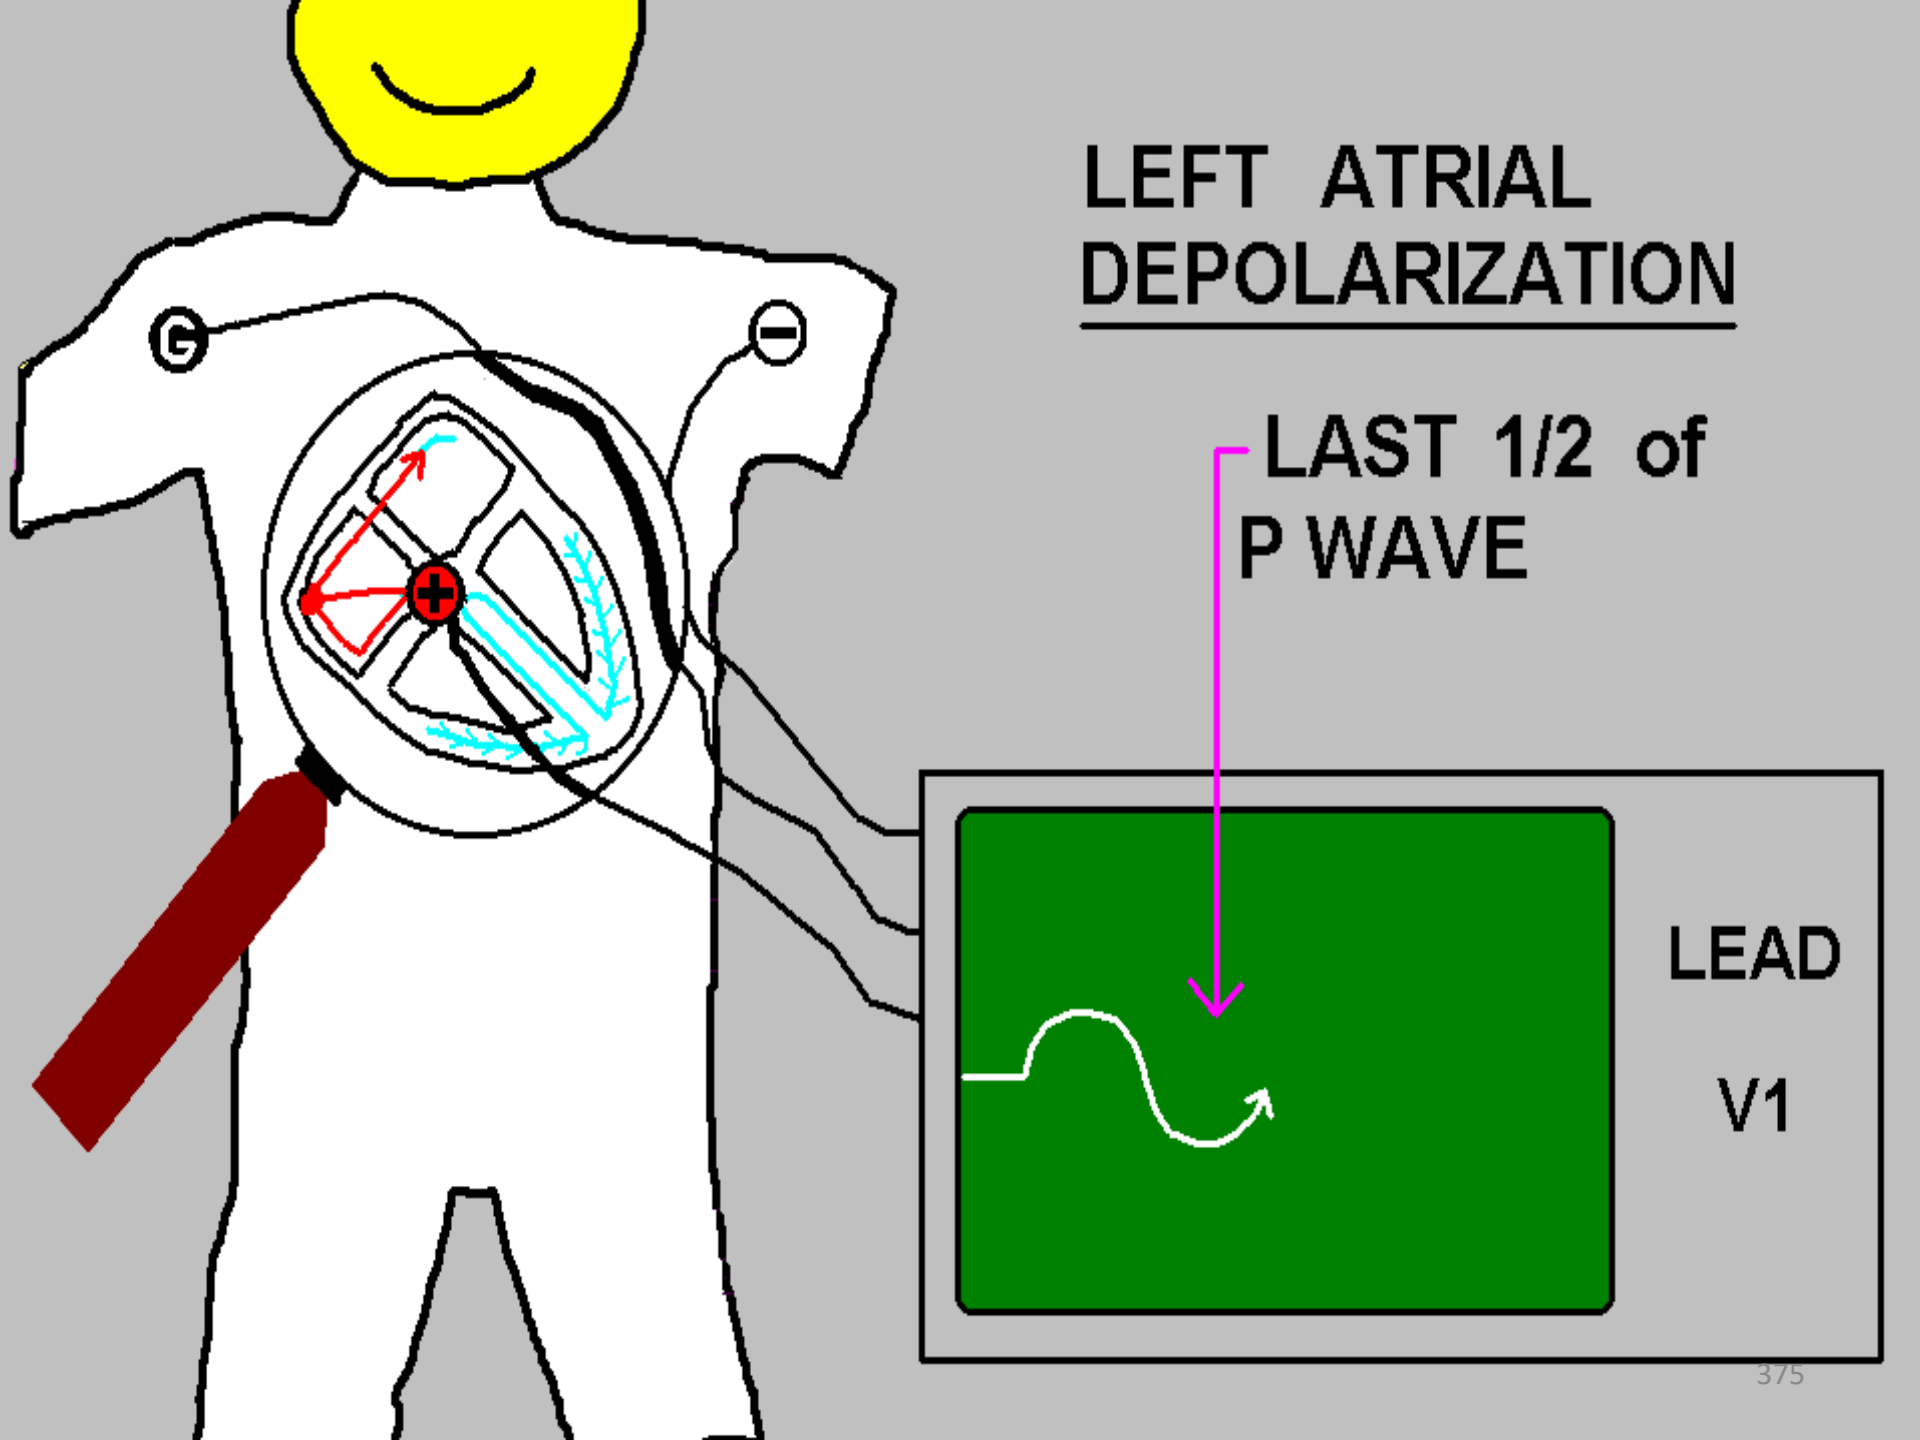
THE P WAVE

- WHEN THE P WAVE IS BI-PHASIC IN V1, IT DISPLAYS BOTH R and L ATRIAL DEPOLARIZATION





RIGHT ATRIAL
DEPOLARIZATION
FIRST 1/2 of
P WAVE
LEAD
V1



LEFT ATRIAL
DEPOLARIZATION
LAST 1/2 of
P WAVE
LEAD
V1

Evaluate P Wave for Atrial Hypertrophy

- Evaluate amplitude and duration in Lead II
- If the P wave it “too tall (>2mm) or too long (>2.5mm)” in Lead II, ***then go to lead V1*** to evaluate P wave.
- In Lead V1, if the first half (positive deflection) of the P wave is LARGER than the second half (negative deflection) it suggests RIGHT ATRIAL HYPERTROPHY (RAH).

More on
Determining
Right – vs – Left
Bundle Branch Block
in Session 2.

THE QRS COMPLEX

QRS HEIGHT

is a reflection of the QRS AMPLITUDE.

The NORMAL QRS AMPLITUDE varies from one lead to another . . .

THE QRS COMPLEX

QRS AMPLITUDE

is influenced by:

- age
- physical fitness
- body size
- conduction system disorders
- chamber hypertrophy

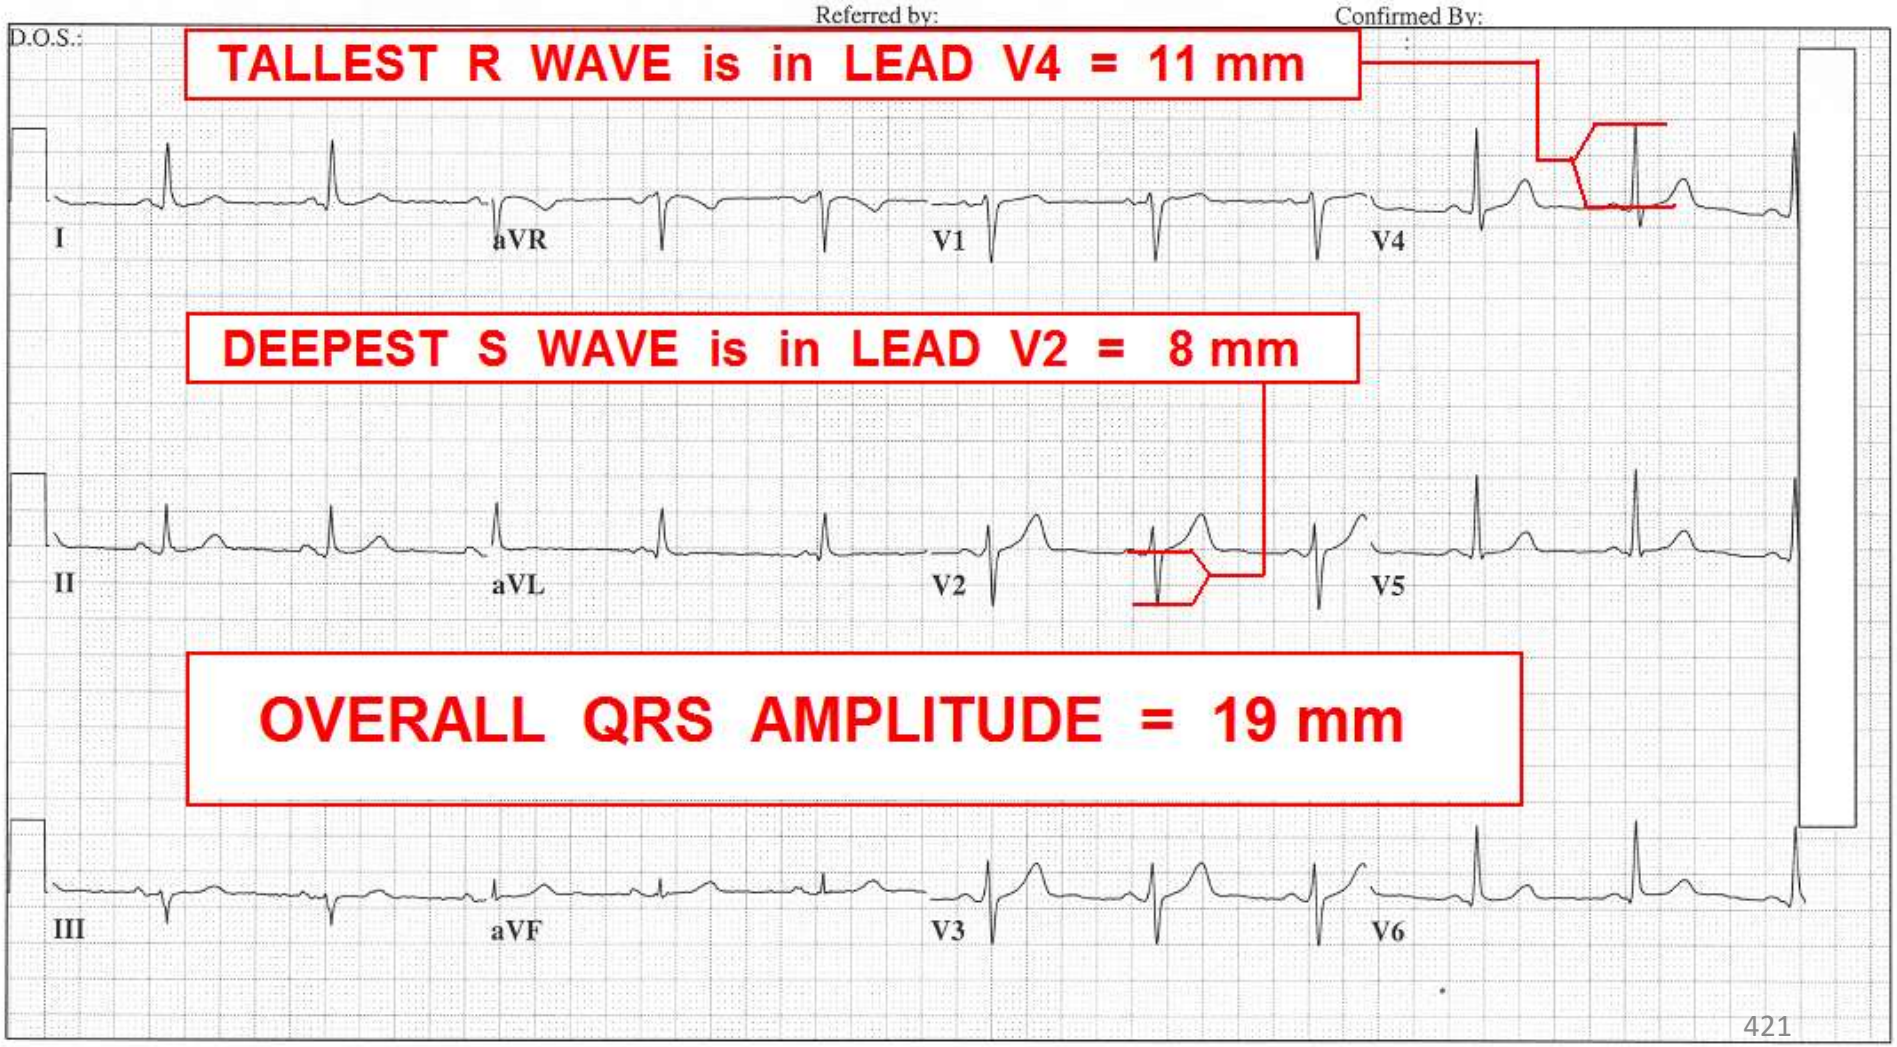
THE QRS COMPLEX

QRS AMPLITUDE

is measured by finding the TALLEST POSITIVE DEFLECTION (R WAVE) and the DEEPEST NEGATIVE DEFLECTION (S WAVE) on the 12 LEAD EKG and ADDING THE VALUES TOGETHER

MEASURING THE "OVERALL QRS AMPLITUDE"

Add the SIZE of the TALLEST R WAVE to the SIZE of the DEEPEST S WAVE . . . .



THE QRS COMPLEX

QRS AMPLITUDE

MAXIMUM NORMAL VALUES are difficult to define due to differences in PATIENT AGE, BODY SIZE, and FITNESS.

HOWEVER A GENERAL VALUE GUIDELINE IS: 3.0 mV (30 mm on normally calibrated EKG)

OVERALL QRS AMPLITUDE TOO HIGH:

(GREATER THAN 3.0 mV / 30 mm)

THINK:

- VENTRICULAR HYPERTROPHY

Hypertrophy “Cheats”:

- **WHEN QRS COMPLEX(ES) “SPEAR” OUTSIDE OF THEIR SPACE.**
- **WHEN QRS COMPLEXES SPEAR THROUGH OTHER LEADS ! . . . . . .**

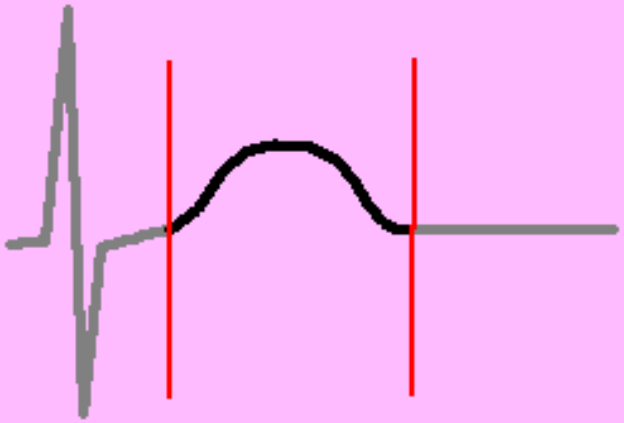
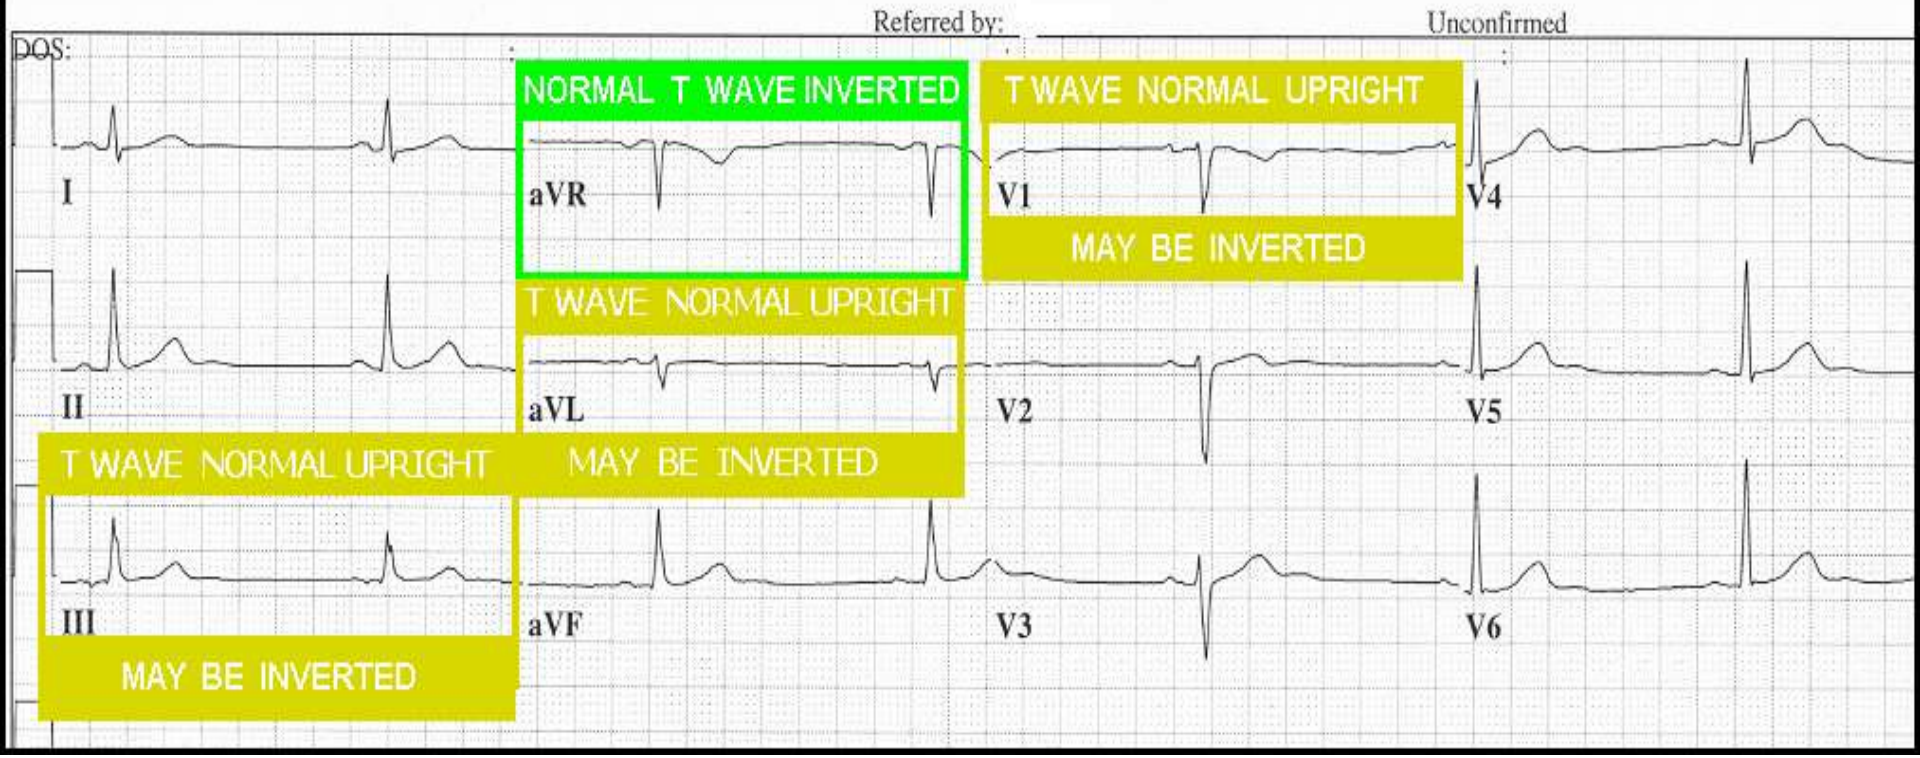
- THERE SHOULD BE NO Q WAVES IN LEADS V1, V2, or V3

THE T WAVE



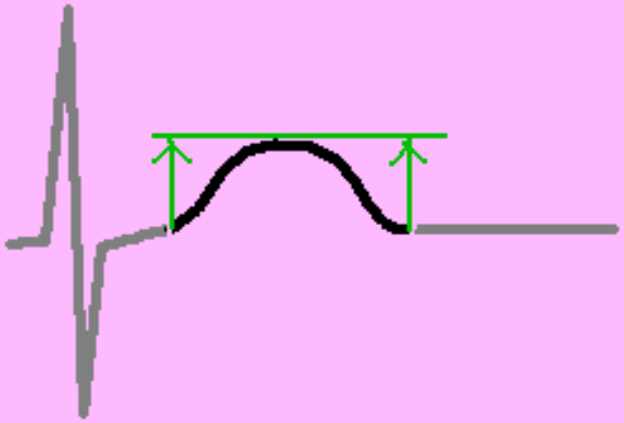
- SHOULD BE A "NICE," ROUNDED, CONVEX SHAPE
- SHOULD BE SYMMETRICAL
- SHOULD BE UPRIGHT IN ALL LEADS, EXCEPT AVR
- MAY BE INVERTED IN LEADS I, III, and V1

Leads where the T WAVE may be INVERTED:



An inverted T wave in TWO OR MORE CONTIGUOUS LEADS = potential problem (ischemia)

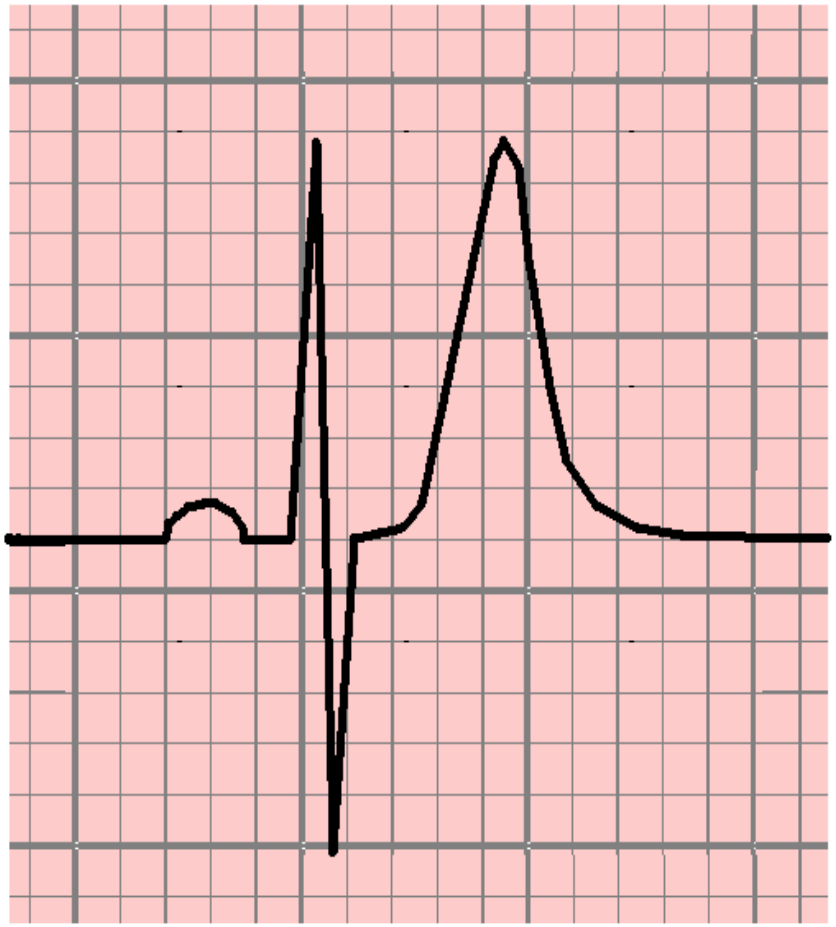
THE T WAVE



AMPLITUDE GUIDELINES:

- IN THE LIMB LEADS, SHOULD BE LESS THAN 1.0 mv (10 mm)
- IN THE PRECORDIAL LEADS, SHOULD BE LESS THAN 0.5 mv (5 mm)
- SHOULD NOT BE TALLER THAN R WAVE IN 2 OR MORE LEADS.

HYPER-ACUTE T WAVES - COMMON ETIOLOGIES:

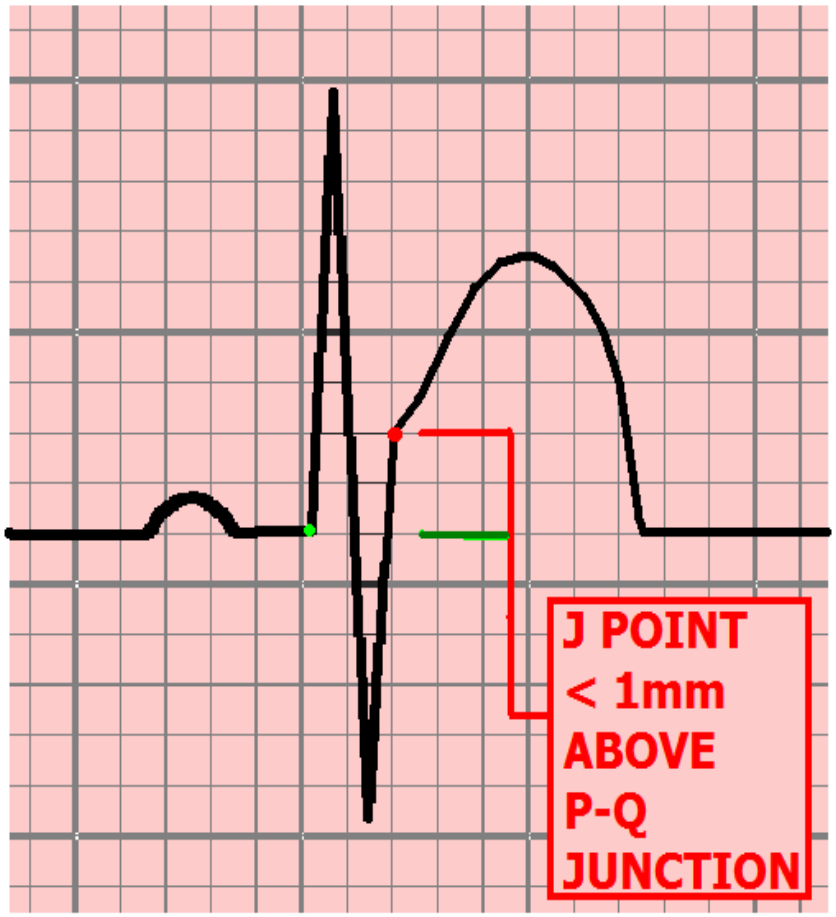


CONDITION:

- HYPERKALEMIA
- ACUTE MI
- TRANSMURAL ISCHEMIA
- HYPERTROPHY

MORE INFORMATION ON HYPERACUTE T WAVES COMING UP SOON . . .

S-T SEGMENT ELEVATION - COMMON ETIOLOGIES:



CONDITION:

- ACUTE INFARCTION
- HYPERKALEMIA
- BRUGADA SYNDROME
- PULMONARY EMBOLUS
- INTRACRANIAL BLEED
- MYOCARDITIS / PERICARDITIS
- L. VENT. HYPERTROPHY
- PRINZMETAL'S ANGINA
- L. BUNDLE BRANCH BLOCK
- PACED RHYTHM
- EARLY REPOLARIZATION & "MALE PATTERN" S-T ELEV.

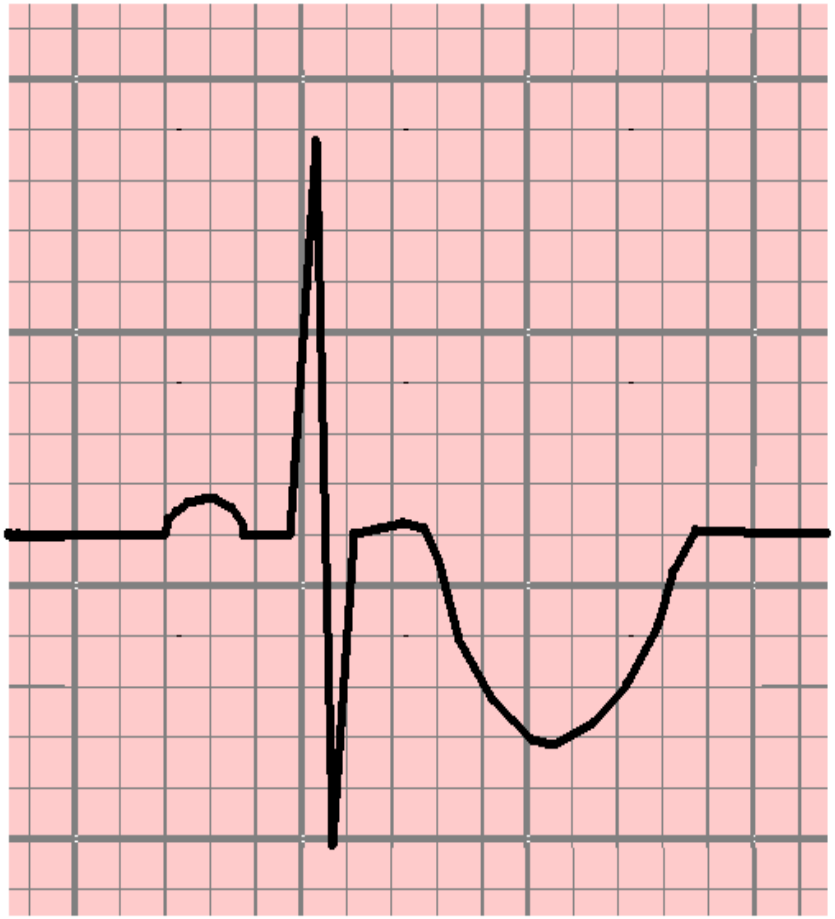
ON THE NEXT PAGE IN YOUR BOOK ARE SOME EXAMPLES OF THE ABOVE CONDITIONS

S-T SEGMENT DEPRESSION - COMMON ETIOLOGIES:

CONDITION:

- RECIPROCAL CHANGES of ACUTE MI
- NON-Q WAVE M.I. (NON-STEMI)
- ISCHEMIA
- POSITIVE STRESS TEST
- VENTRICULAR HYPERTROPHY (STRAIN PATTERN)
- WOLFF-PARKINSON-WHITE
- OLD MI (NECROSIS vs. ISCHEMIA)
- DIGITALIS
- R. BUNDLE BRANCH BLOCK

T WAVE INVERSION - COMMON ETIOLOGIES:



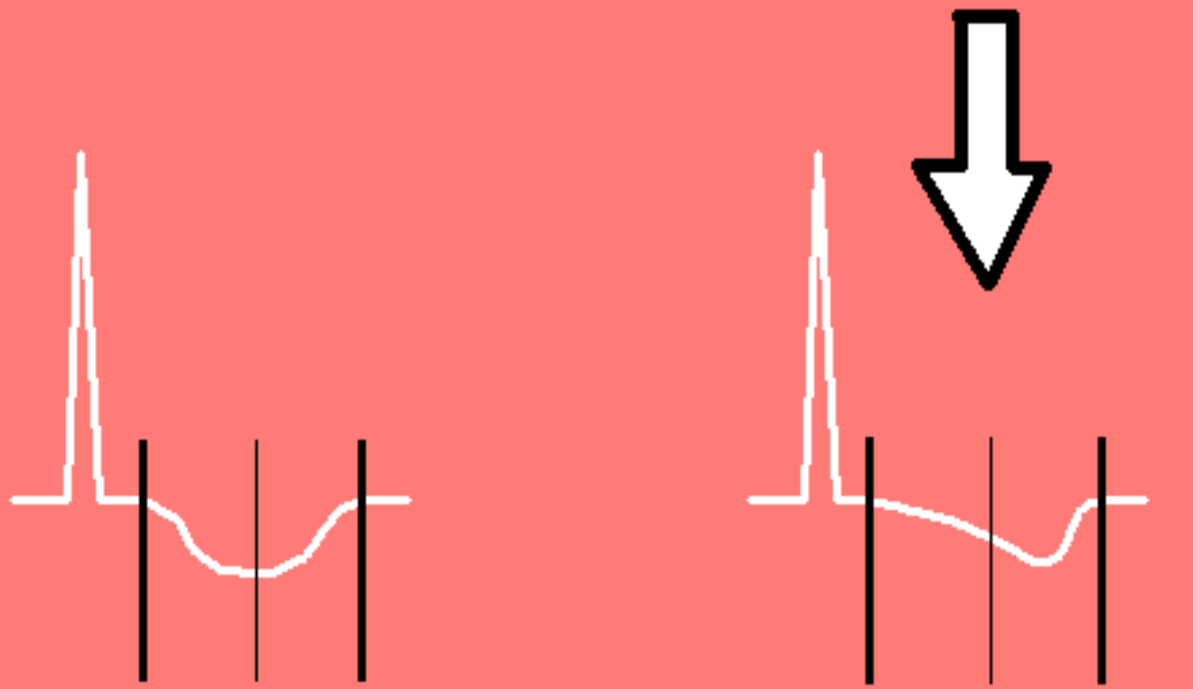
CONDITION:

- MYOCARDITIS
- ELECTROLYTE IMBALANCE
- ISCHEMIA
- POSITIVE STRESS TEST
- CEREBRAL DISORDER
- MITRAL VALVE PROLAPSE
- VENTRICULAR HYPERTROPHY
- WOLFF-PARKINSON-WHITE
- HYPERVENTILATION
- CARDIOACTIVE DRUGS
- OLD MI (NECROSIS vs. ISCHEMIA)
- DIGITALIS
- R. BUNDLE BRANCH BLOCK
- NO OBVIOUS CAUSE

CHAMBER ENLARGEMENT

VENTRICULAR STRAIN PATTERNS

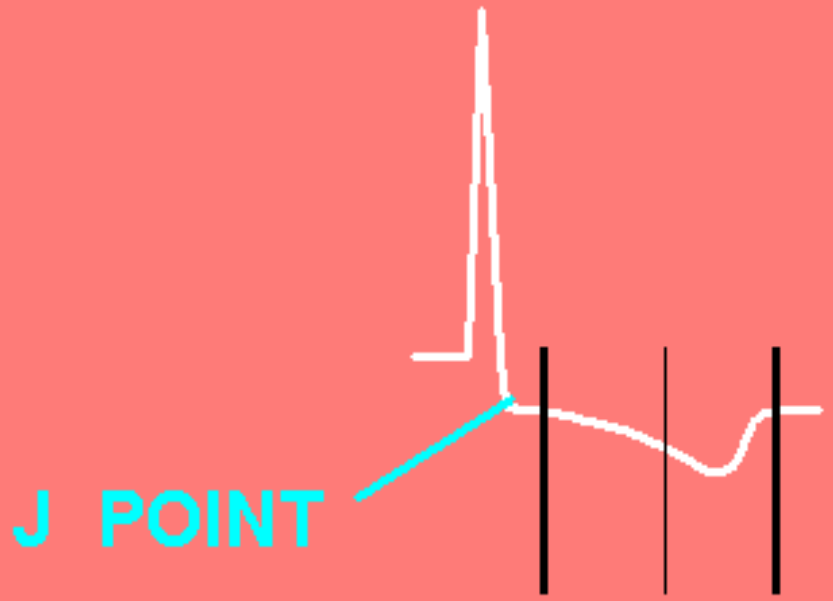
☞ T-WAVES ARE INVERTED and ASYMMETRICAL



CHAMBER ENLARGEMENT

VENTRICULAR STRAIN PATTERNS

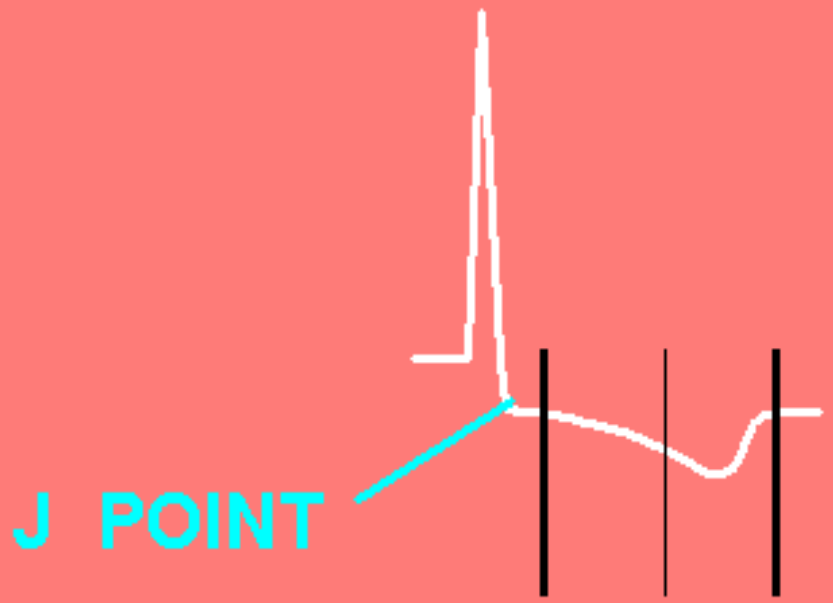
- T WAVES ARE INVERTED AND ASMMETRICAL
- THERE MAY BE S-T SEGMENT DEPRESSION



CHAMBER ENLARGEMENT

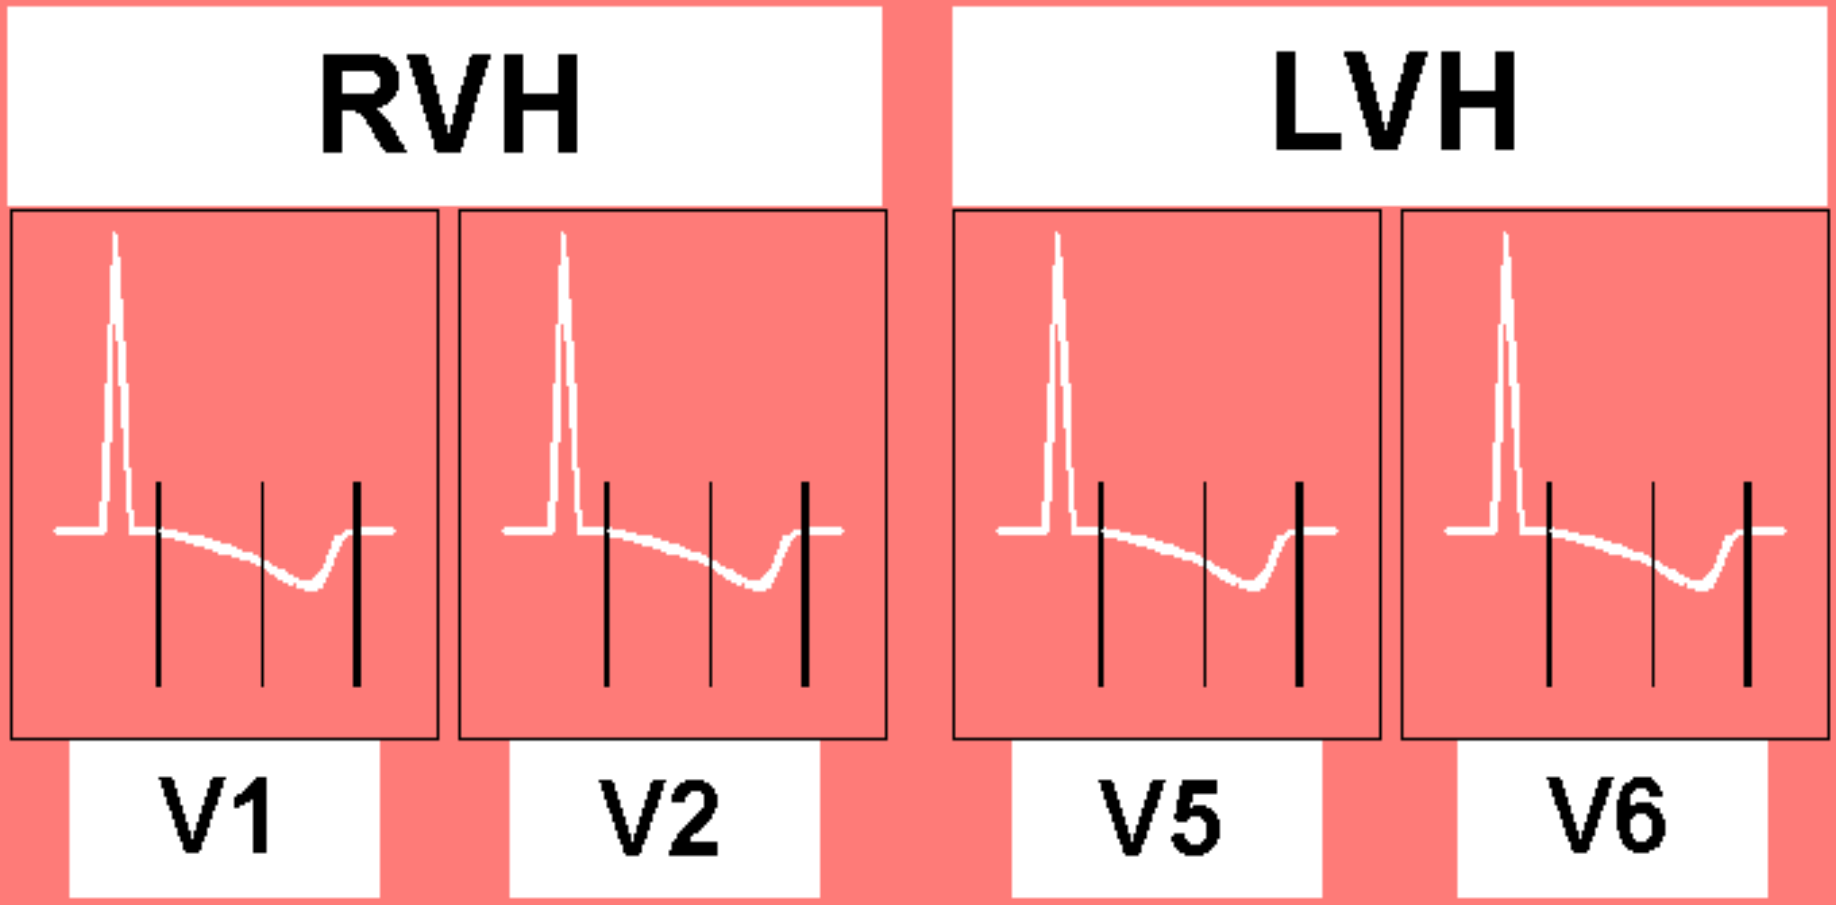
VENTRICULAR STRAIN PATTERNS

STRAIN PATTERNS ARE INDICATIVE OF SYSTOLIC OVERLOAD -- THE VENTRICLES HAVING TO OVERCOME GREAT FORCE TO EXPEL BLOOD.



CHAMBER ENLARGEMENT

VENTRICULAR STRAIN PATTERNS



hang in there ! . . . .
it's almost LUNCH TIME ! ! ! !

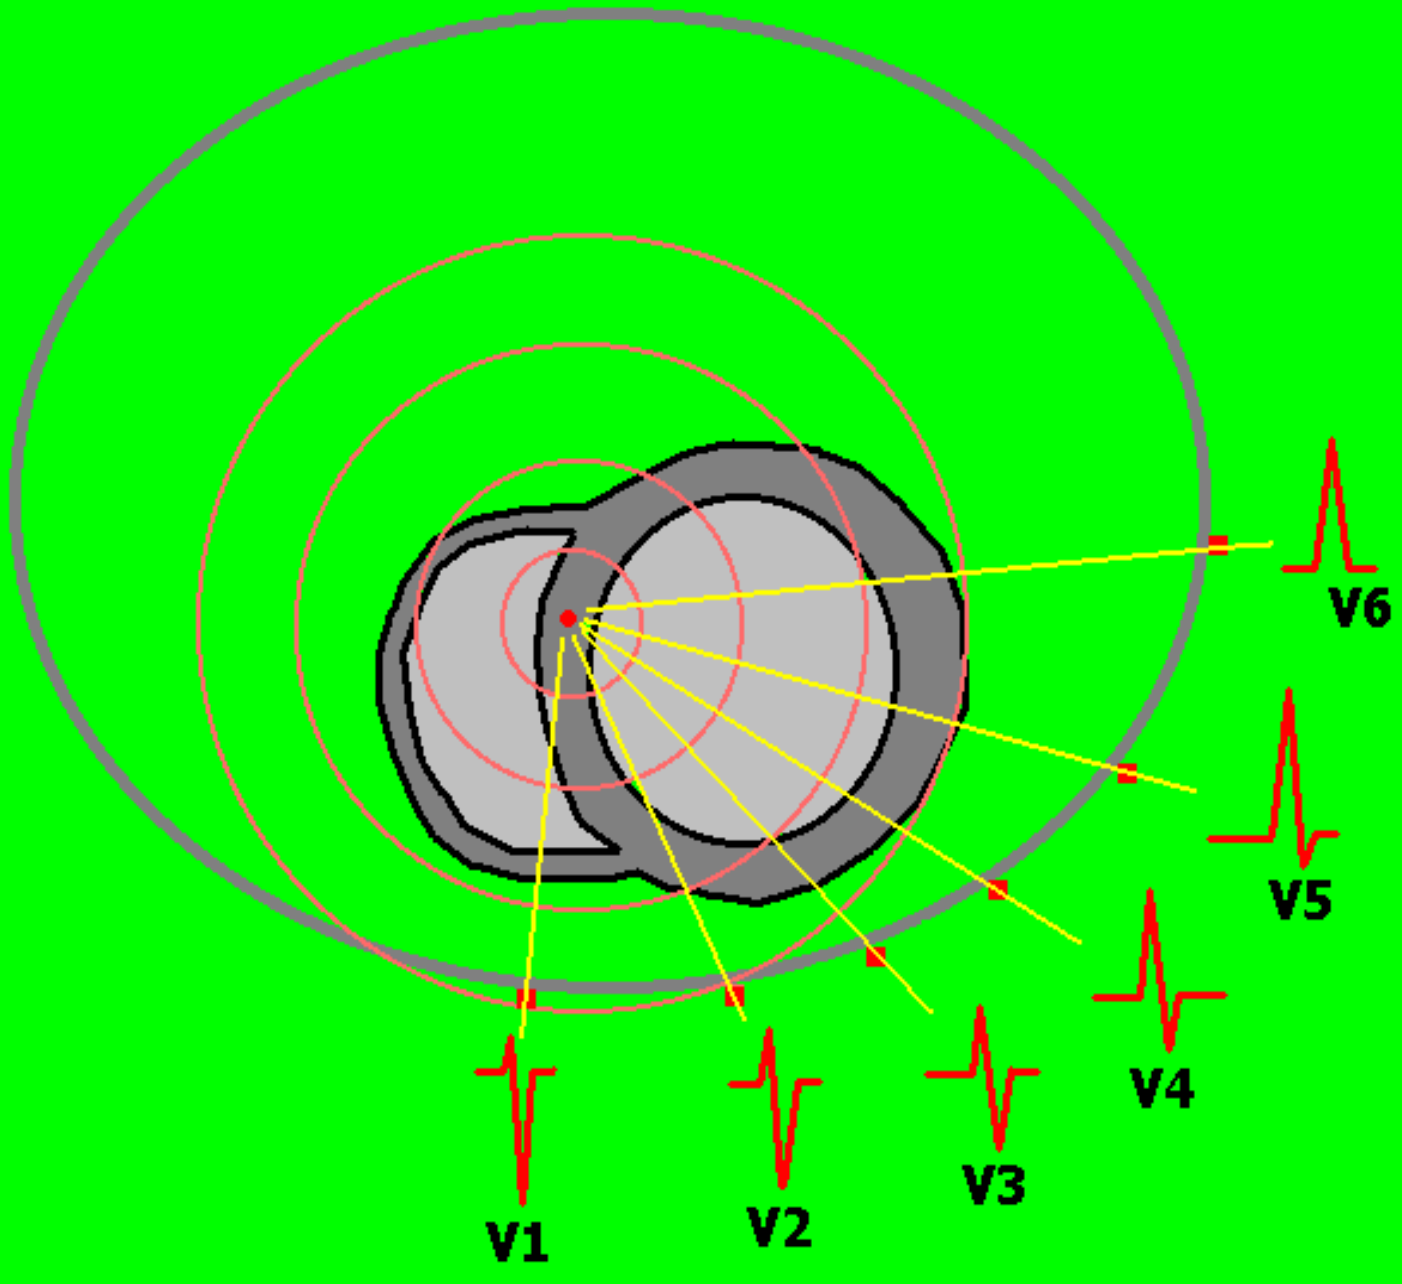
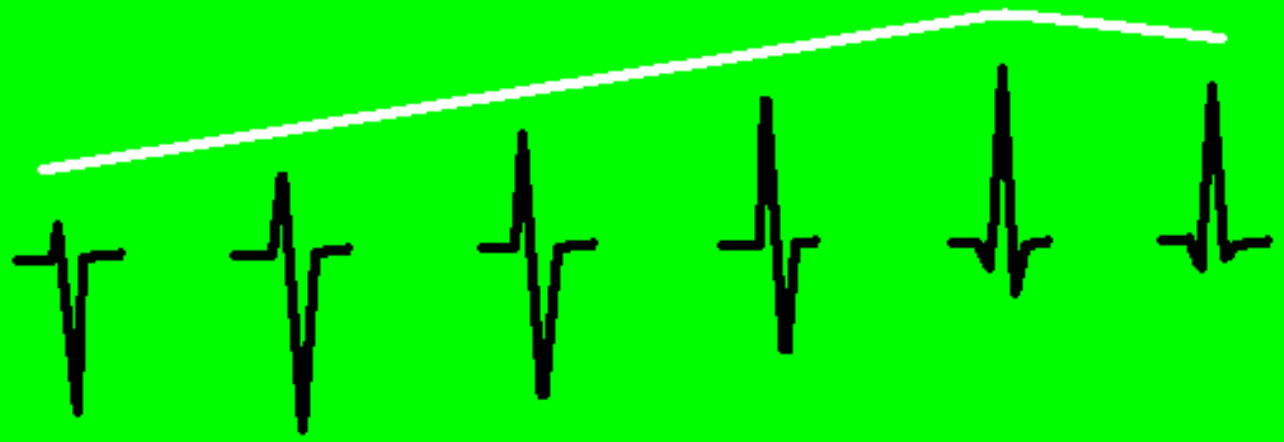
AXIS ROTATION



ASSESSING AXIS ROTATION:

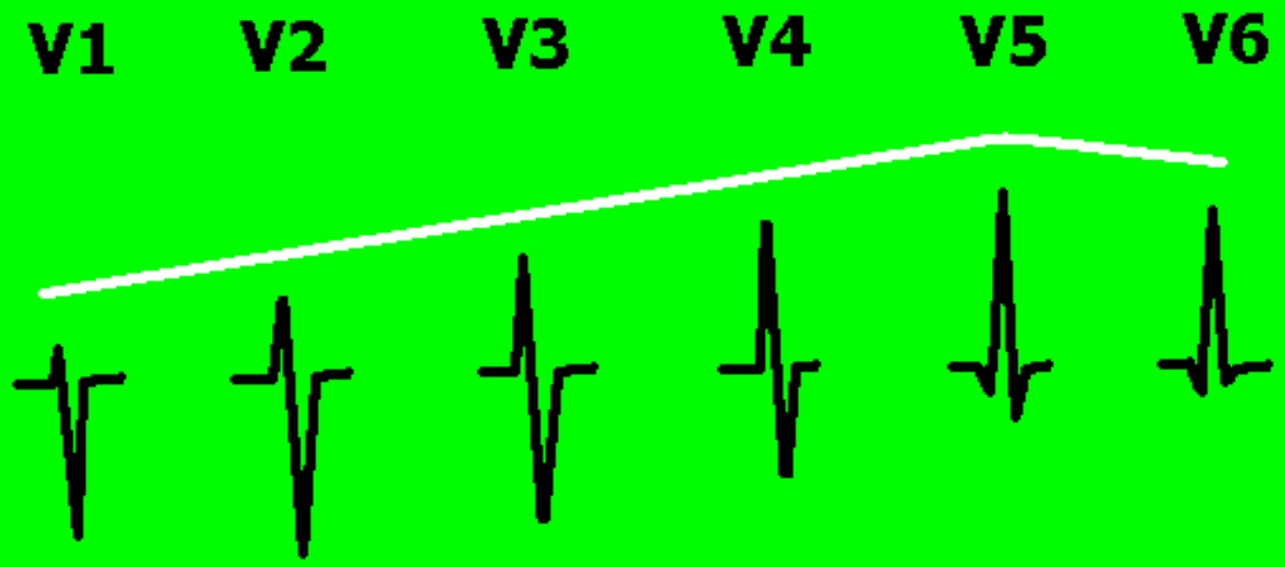
V1 V2 V3 V4 V5 V6

1. R - WAVE PROGRESSION



2. IDENTIFICATION OF TRANSITION

ASSESSING AXIS ROTATION:



3. **RECALL COMMON PATTERNS of ABNORMAL R-WAVE PROGRESSION to help you build your list of POSSIBLE DIAGNOSES.**

AXIS ROTATION

TRANSITION

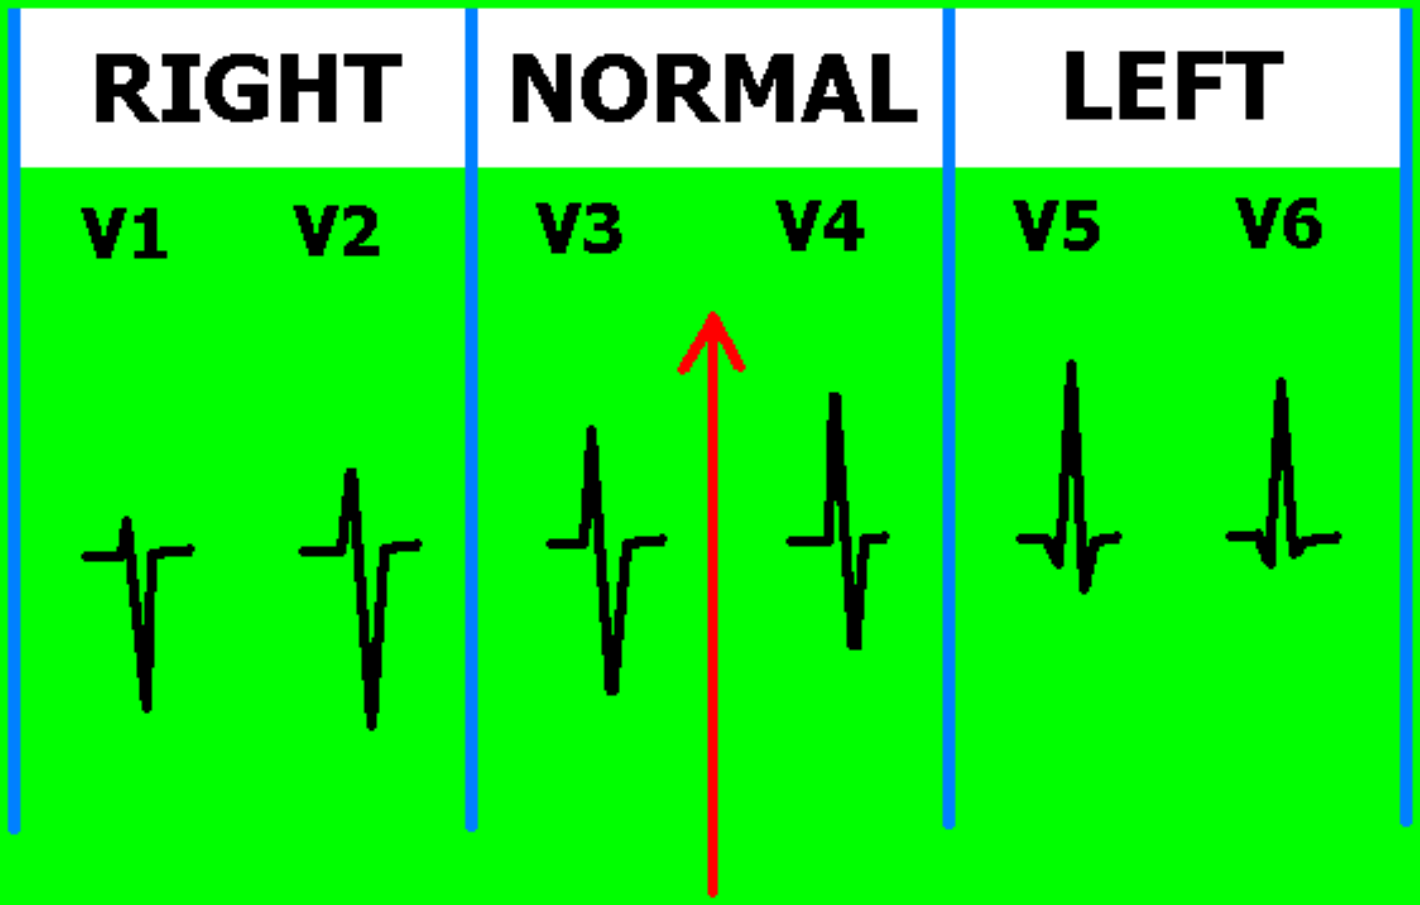
OCCURS IN THE LEAD WHERE THE QRS IS THE MOST **BIPHASIC**

AXIS ROTATION

IMPORTANT TRANSITION RULE

"Transition shifts TOWARD HYPERTROPHY and AWAY FROM NECROSIS."

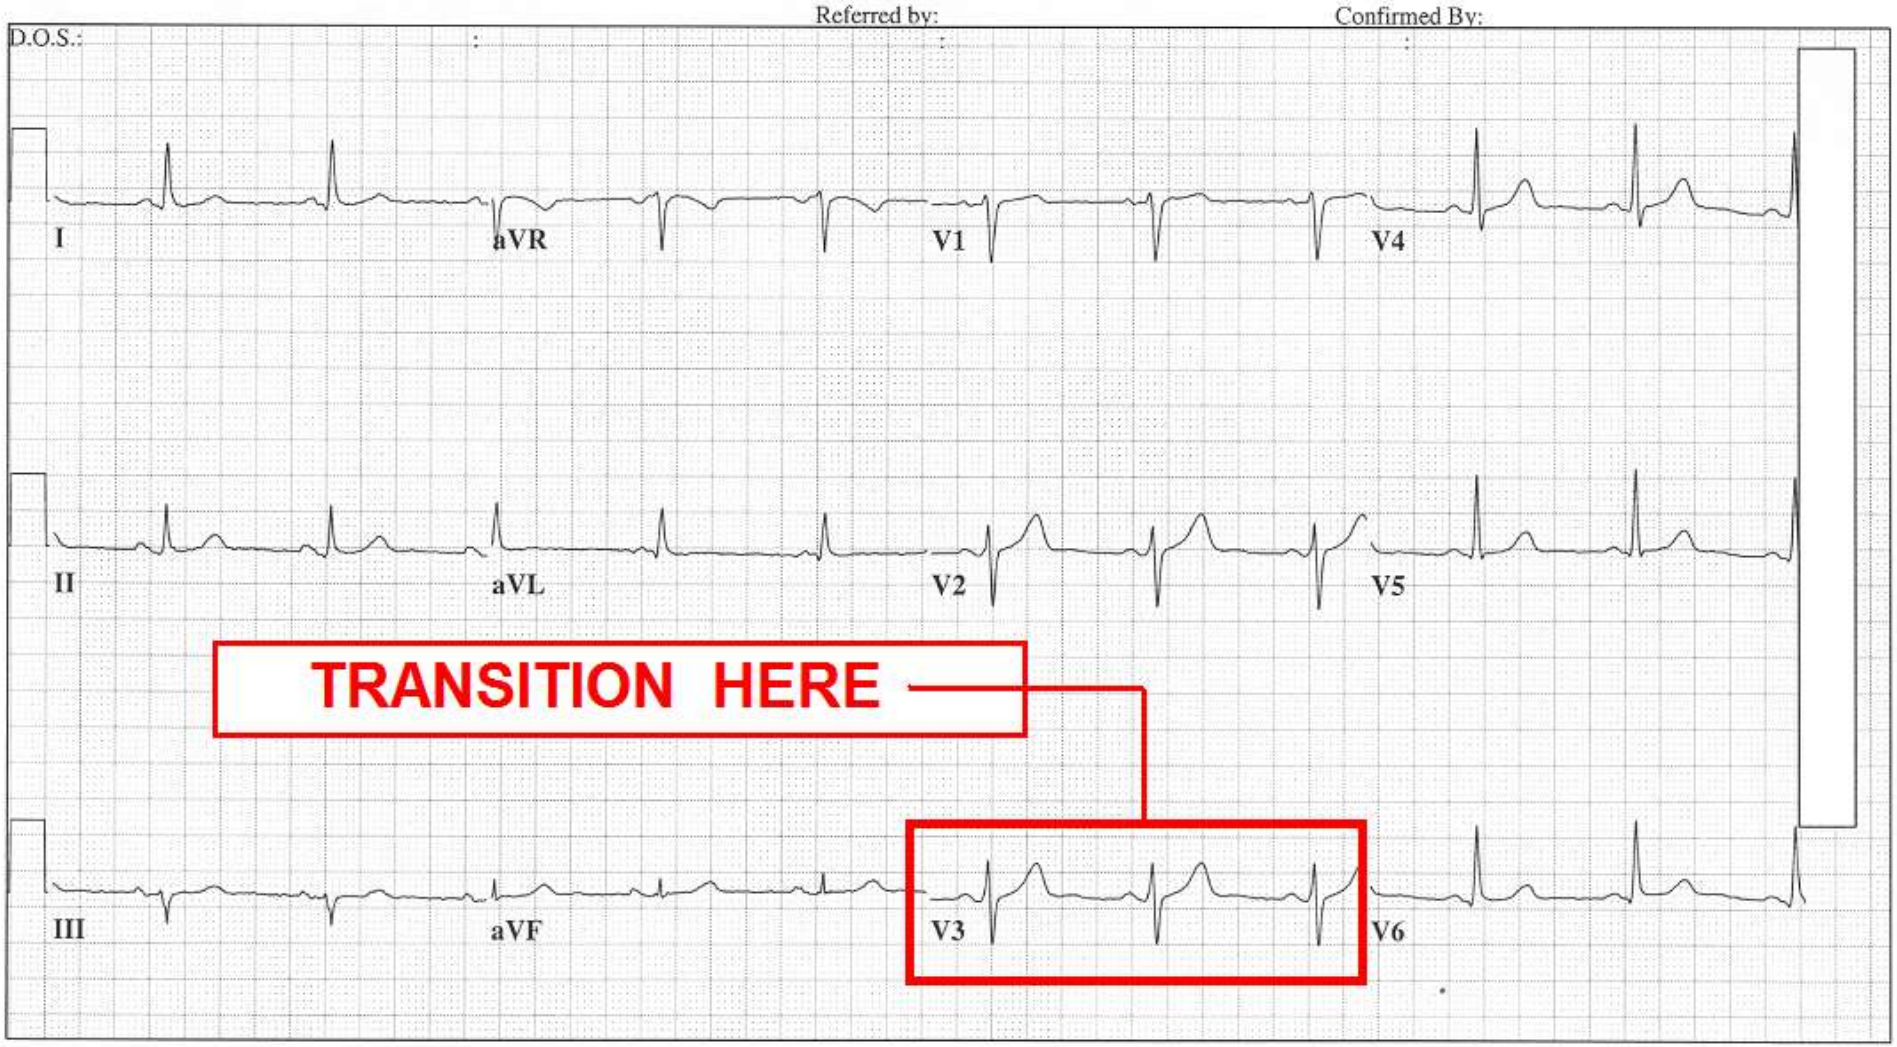
AXIS ROTATION



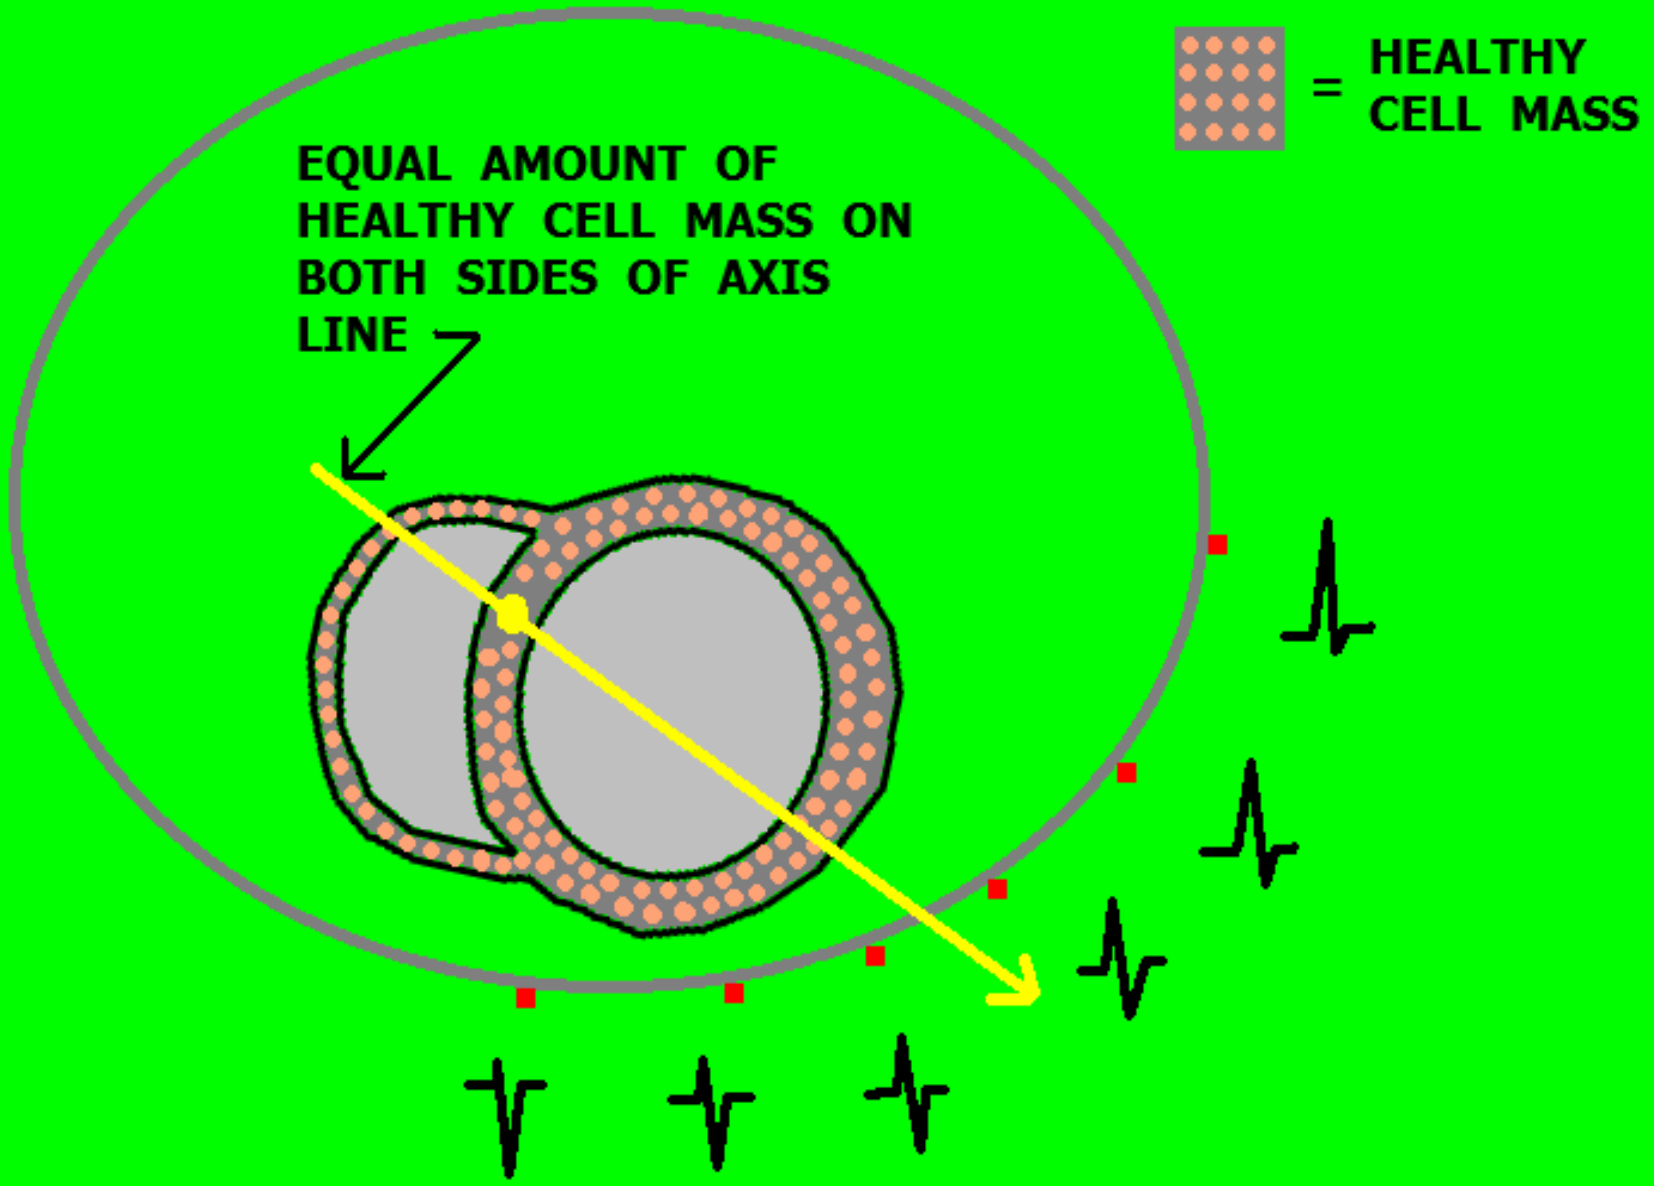
TRANSITION SHOULD OCCUR IN LEADS V3 or V4

NORMAL TRANSITION

IS BETWEEN LEADS V3 and V4



NORMAL TRANSITION



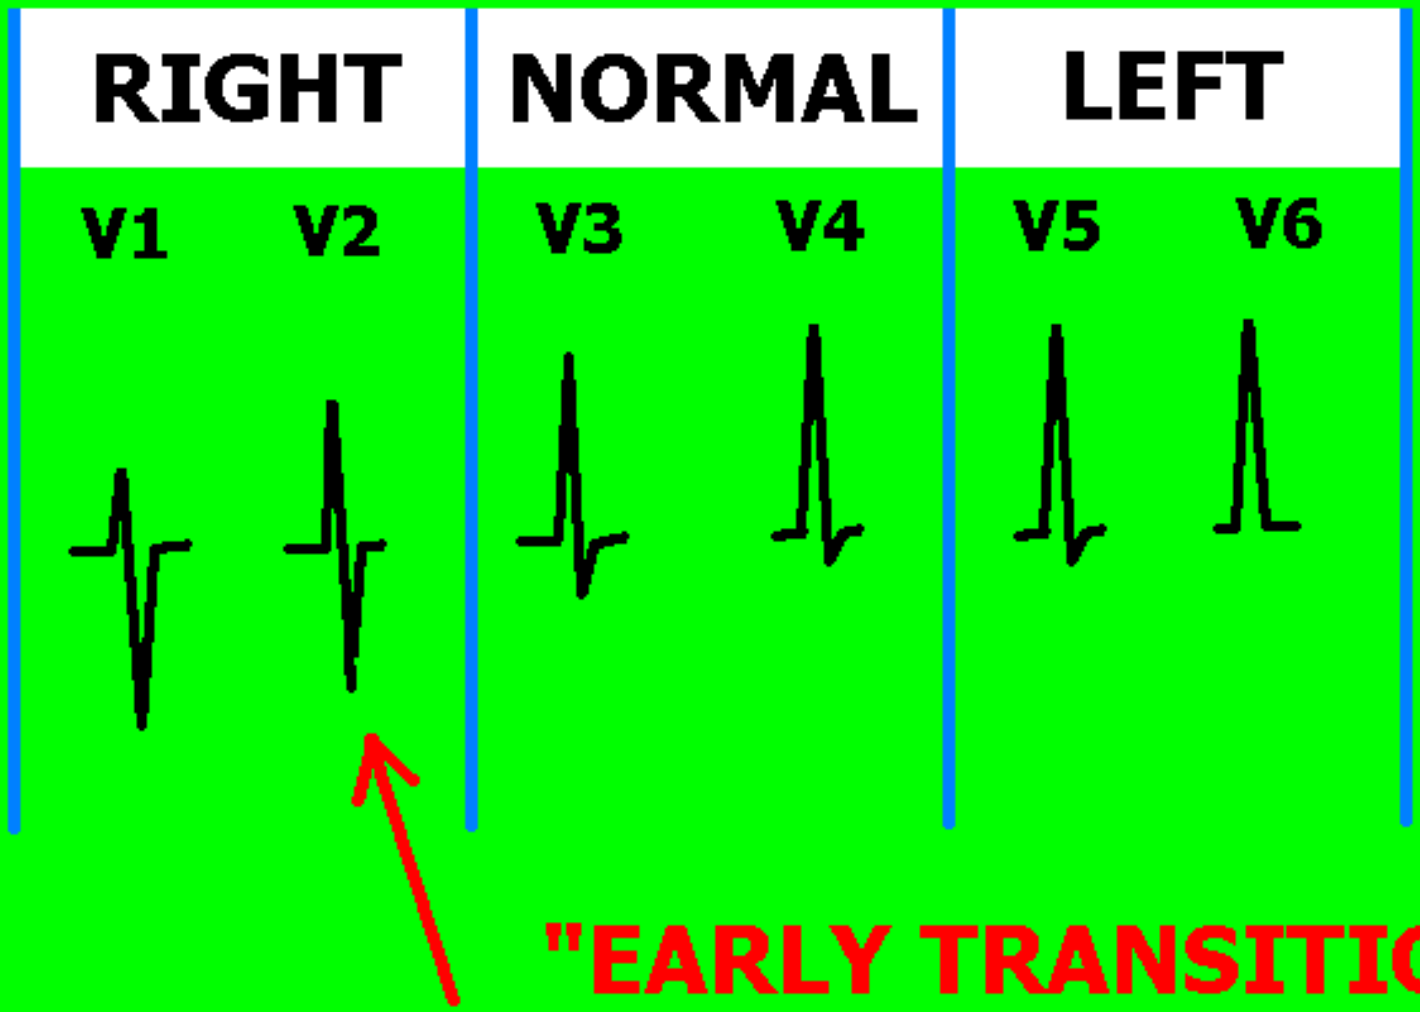
ASSESSING AXIS ROTATION:

IMPORTANT NOTES:

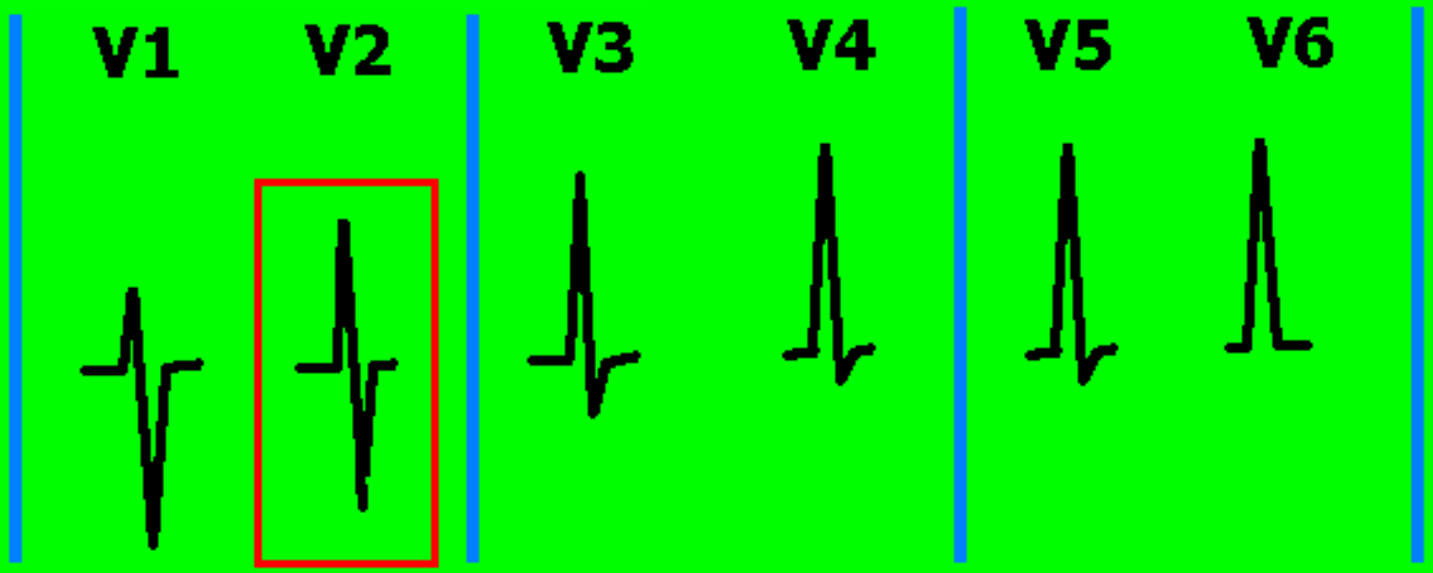
- As with all EKG-made DIAGNOSES, you must consider the TOTALITY of the PATIENT'S PRESENTATION. This includes the PATIENT'S CLINICAL PRESENTATION, RISK FACTOR PROFILE, and your INDEX OF SUSPICION.

- Validate all EKG-suspected DIAGNOSES with Additional, MORE ACCURATE diagnostic testing, e.g.: CARDIAC ECHO, CARDIAC CATHERIZATION, ELECTROPHYSIOLOGIC TESTING, MRI, etc.

AXIS ROTATION



* COMMON CAUSES of EARLY TRANSITION



1. Right Bundle Branch Block
2. Right Ventricular Hypertrophy
3. Old Posterior Wall MI
4. Wolff-Parkinson-White (type A)

LEFT - SIDED PATHWAY - FROM MARRIOTT'S
"Practical Electrocardiography - 10th Edition," 2000

COMMON CAUSES OF EARLY TRANSITION

. . . . SOME HELPFUL CLUES:

1. **Right Bundle Branch Block (RBBB)**
   - QRS wider than 120ms
   - Supraventricular rhythm (normal P : QRS relationship)
   - RSR' or RR' ("notching") in V1, V2, and/or V3
2. **Right Ventricular Hypertrophy (RVH)**
   - Corresponding Right Atrial Hypertrophy (RAH)
   - Right Axis Deviation (RAD)
   - QRS in LEAD I more NEGATIVE than POSITIVE (R<S)
3. **Old Posterior Wall MI**
   - Usually accompanied by OLD INFERIOR WALL MI
   - Does NOT abnormally widen the QRS complex
4. **Wolff-Parkinson-White (WPW) type A**
   - Short P-R Interval
   - Presence of Delta Waves
   - Wide QRS complexes

   - V1 S wave + V5 or V6 R wave > 35 mm
   - R or S wave in any LIMB LEAD > 2.0 mV (20 mm)
4. **Wolff-Parkinson-White (Type B)**
   - Presence of DELTA waves
   - Short P-R Interval (< 120 ms)
   - Wide QRS (> 120 ms)

COMMON CAUSES OF LATE TRANSITION

. . . . WITH SOME *COMMON* HELPFUL CLUES:

1. **Old Anterior MI**
   - Q Waves in V1, V2, and /or V3
   - Other causes of LATE TRANSITION ruled out
2. **Left Bundle Branch Bock (LBBB)**
   - Supraventricular Rhythm
   - QRS wider than 120 ms (.12 sec)
   - RsR' or RR' ("notching") in V5 and/or V6
3. **Left Ventricular Hypertrophy (LVH)**
   - Corresponding Left Atrial Hypertrophy (LAH)
   - T wave Strain Pattern V5 / V6
   - Intrinsicoid Deflection in V5 / V6 > 45 ms
   - V1 S wave + V5 or V6 R wave > 35 mm
   - R or S wave in any LIMB LEAD > 2.0 mV (20 mm)
4. **Wolff-Parkinson-White (Type B)**
   - Presence of DELTA waves
   - Short P-R Interval (< 120 ms)
   - Wide QRS (> 120 ms)
